موضوع: ضوابط و معیارهای فنی شبکه های آبیاری وزهکشی نقشه های تیپ سازه های فنی	دستورالعمل شماره ۲۲-۵۶/۳۹۲-۱ مورخ ۷۱/۱/۹
تذکر:	کد

باستناد ماده ۲۳ قانون برنامه وبودجه کشور وآئین‌نامه استانداردهای اجرائی طرحهای عمرانی این دستورالعمل از نوع گروه ۲ مذکور درماده هفت آئین‌نامه در یک صفحه صادر میگردد.

تاریخ مندرج درماده ۸ آئین‌نامه درمورد این دستورالعمل ۷۱/۷/۱ میباشد.

به پیوست نشریه شماره ۱۰۷ دفتر تحقیقات ومعیارهای فنی این سازمان تحت عنوان " ضوابط و معیارهای فنی شبکه های آبیاری و زهکشی . نقشه های تیپ سازه های فنی " اعلام می شود .

دستگاههای اجرایی ومهندسان مشاور می توانند مفاد نشریه یاد شده وضوابط و معیارهای مندرج در آن را ضمن تطبیق با شرایط کار خود در طرحهای عمرانی مورد استفاده قرار دهند .

مسعود روغنی زنجانی
معاون رئیس جمهور و
رئیس سازمان برنامه وبودجه

omoorepeyman.ir

مقدمه

هدف از تهیه این نشریه، تشریح تیپ سازه‌های فنی شبکه‌های آبیاری و زهکشی، همانگی و پرهیز از تکرار خدمات مهندسی در پروژه‌هائی است که پس از تدوین این ضوابط اجرا، خواهند شد. نتایج عمومی این مطالعات بصورت نقشه‌های تیپ اجرائی کانالها و سازه‌های فنی عمده شبکه‌های آبیاری و زهکشی برای ظرفیت‌های تا ۳ مترمکعب در ثانیه ارائه شده است. نقشه‌های تیپ این مجموعه در اندازه‌های A2 تهیه و در هر یک از آنها برحسب مورد جداول یا توضیحات ضروری ارائه شده است. این مجموعه در ۱۰ بخش بشرح زیر تنظیم گردیده است:

بخش اول	سازه‌های انتقال جریان آب	Conveyance Structures
بخش دوم	سازه‌های تنظیم جریان آب	Regulating Structures
بخش سوم	سازه‌های حفاظتی	Protecting Structures
بخش چهارم	سازه‌های زهکشی	Drainage Structures
بخش پنجم	سازه‌های اندازه‌گیری جریان آب	Water Measurement Structures
بخش ششم	سازه‌های انرژی گیر	Energy Dissipator Structures
بخش هفتم	لوله‌ها	Pipes
بخش هشتم	وسایل ایمنی	Safety Facilities
بخش نهم	مقاطع کانالها و راههای دسترسی	Typical Canal & Road Sections
بخش دهم	اطلاعات عمومی	General Notes

مطالب مندرج روی نقشه‌های شماره 20/2/1/01,02,03 اطلاعات عمومی مربوط به غلب سازه‌های این مجموعه را در بر دارد.

مبانی طراحی در انجام محاسبات فنی سازه‌های این نشریه بشرح زیر است:

۱ آئین نامه: - طراحی سازه‌ها براساس آئین نامه AASHTO-83 انجام شده است.

- حداقل میلگرد لازم برای کنترل ترکهای سازه‌های آبی مطابق با ضوابط U.S.B.R. تعیین شده است.
- حداکثر فاصله میلگردها طبق استاندارد شماره ۵-۱۸ موسسه استاندارد و تحقیقات صنعتی ایران تعیین شده است.
- بار زنده پلهای ماشین رو مطابق با ضمیمه دستور فنی شماره ۱۱ وزارت راه - سازمان برنامه تعیین شده است.
- بار زنده پلهای پیاده رو مطابق با ضوابط U.S.B.R تعیین شده است.
- تمامی عملیات اجرائی باید با مشخصات فنی عمومی شبکه‌های آبیاری و زهکشی نشریه شماره ۱۰۸ دفتر تحقیقات و معیارهای سازمان برنامه و بودجه مطابقت داشته باشد.

۲- مصالح مصرفی: ۲-۱- بتن: بتن مورد مصرف با عیار ۲۵۰ کیلوگرم سیمان در متر مکعب میباشد.
مقاومت مشخصه این بتن ۲۰۰ کیلوگرم بر سانتیمتر مربع در ۲۸ روز میباشد.

۲-۲- میلگرد: میلگرد مصرفی از نوع A-II با تنش جاری شدن ۳۰۰۰ کیلوگرم بر سانتیمتر مربع میباشد.

۲-۳- سیمان: در مناطقی که بتن در معرض تاثیر سولفات ها قرار گیرد باید از سیمان تیپ II یا سیمان تیپ V استفاده شود که بستگی به میزان سولفات موجود در آب و خاک دارد.

۳- روش محاسبه:

در محاسبات سازه‌ها از روش تنش مجاز Working Stress استفاده شده است. آنالیز مورد استفاده، یک آنالیز خطی است که چون میلگرد مصرفی از نوع A-II است و تنش مجاز آن $\frac{2}{3}f_y$ = ۱۵۰۰ کیلوگرم بر سانتیمتر مربع میباشد نتایج محاسبات با روش نهایی تغییر چندانی در نتایج طراحی با روش تنش مجاز نمیدهد.

۴- بارگذاری: - بار زنده ماشین آلات مطابق با ضمیمه دستور فنی شماره ۱۱ وزارت راه، سازمان برنامه تعیین شده که عبارتست از کامیون استاندارد ۴۵ تنی
بار زنده پیاده رو بشرح زیر میباشد:

- پیاده روی ساختمانها با Stoplog برای بار زنده ۷۵۰ کیلوگرم بر متر مربع طراحی شده.
- پیاده روی ساختمانها بدون Stoplog برای بار زنده ۵۰۰ کیلوگرم بر متر مربع طراحی شده.

- برای تعیین فشار اکتیو خاک (فشار افقی) از آئین نامه انجمن مهندسین آبیاری آمریکا[1] استفاده شده است. در این آئین نامه انواع خاکریزهای پشت دیوارهای حائل در پنج گروه طبقه بندی گردیده و فشار افقی خاک برای هر گروه تعیین شده است. با مطالعه نقشه خاکشناسی ایران میانگین فشار افقی خاک گروههای ۲ و ۳[2] برای بارگذاری انتخاب شده است که میزان آن ۶۱ کیلوگرم بر متر مربع میباشد.

۵- جزئیات آهن گذاری:

برای رعایت مهارتهای کارگاهی در ایران آهن گذاری طبق ضوابط آئین کاربرد ۵-۱۸ موسسه استاندارد و تحقیقات صنعتی ایران انجام شده است و فقط برای حداقل درصد میلگرد از ضوابط U.S.B.R. استفاده شده است.

برای اعضاء و قطعات بتنی با ضخامت کمتر از ۲۰ سانتیمتر یک ردیف آرماتور و برای ضخامت ۲۰ سانتیمتر و بیشتر دو ردیف آرماتور منظور شده است.
در بعضی موارد که آهن با قطر ۱۴ میلیمتر سطح مقطعی بیشتر از سطح مقطع مورد نیاز داشته است از آهن شماره ۱۲ استفاده شده است.
حداقل قطر آهنهای سازه‌های آبی #4 است که معادل آن در جهت ضرب اطمینان میلگرد آجدار نمره ۱۴ منظور شده است.
حداکثر فاصله آهنها: حداکثر فاصله آهنهای خمشی ۲۵ سانتیمتر و یا ۱.۵ برابر ضخامت دال میباشد. در مواردیکه مقاومت خمشی دال با آهن گذاری با فاصله ۲۵ سانتیمتر جوابگو از لنگر خمشی موجود باشد فاصله آهنها ۳۰ سانتیمتر شده است.
حداکثر فاصله آهنهائی که برای جلوگیری از ترک خوردن بتن بکار رفته ۳۳ سانتیمتر است.

در پایان لازم است از آقای احمد آل یاسین، آقای یوسف شفیعی، آقای امیر موشنگ بان، آقای حسین حجازی کناری، آقای حمید ساسانی، آقای صابر طیب زاده و خانم فهمه‌ش مسیبان و خانم پری شهبازنژاد کارشناسان محترم دفتر تحقیقات و معیارهای فنی، مهندسین مشاور پاسیلاک که مسئولیت تهیه این مجموعه را عهده‌دار بوده‌اند و نیز کارشناسان محترم زیر که در بررسی نهائی این نشریه همکاری داشته‌اند تشکر و قدردانی نماید:

آقایان حسین شفیعی فرد و سید اکبر اباشی	از سازمان برنامه و بودجه
آقایان حسن شنطیا و صدیق شابوری	از مهندسین مشاور یکم
آقایان جعفر لطفی و تراب شاه کاظمی	از مهندسین مشاور مهاب قدس

2-2 Type 3 - Fine silty sand, granular materials with conspicuous clay content; or residual soil with stones

omoorepeyman.ir

GENERAL NOTES

Unless otherwise shown on reinforcement drawings, details and notes shown have are typical for all reinforcement drawings that are refered to this drawing.

ENGINEER:

The Engineer is an Engineering organization or body who uses these drawings for construction purposes

DESIGN CRITERIA:

Structural design is based on working stress method using $f'c = 250 Kg/cm^2$ specified compressive concrete strength at 28 days (or $300 Kg/cm^2$ for cubic sample, concrete B_300) and $fy = 3000 Kg/cm^2$ Specified minimum yield strength of reinforcement.

Both A C I 318 (83) and the AASHTO (77) standards have been used for design of structures.

Thickness of concrete or reinforced concrete members are shown minimum, and can be increased by the ENGINEERS if required.

BEARING CAPACITY:

Foundation bearing pressures for small structures are of small magnitude and will ordinarily be less than allowable bearing pressure for the various soil types.

Foundation treament is required however for low density or expansive soils.

Unsuitable material should be overexcavated and replaced with compacted, nonexpansive soil.

LEAN CONCRETE:

In order to have a clean and stable base for pouring concrete & for formwork of foundation, a layer of lean concrete (150 Kg. cement/m^3) with at least 10cm. thickness may be used with prior approval of the ENGINEER.

JOINTS:

Shear key will be used in wall to foundation construction joints as directed by the ENGINEER.

Waterstop in expantion and contraction joints filler material and location of expansion joints shall be directed by the Engineer based upon locol conditions.

Placement of construction joints during concrete placement will be in accordance with the ENGINEER'S approval.

SYMBOLS:

A circle at the end of a bar indicates a bend.

Splices shown thus ——+—+—— indicate a lapped splice, not a bend in the bar.

DIMENSIONS

Dimensions shown for the bars in the list of reinforcement are to the back of the bars and dimensions shown for bar spacings are to the center lines of the bars unless otherwise shown. Clear cover dimensions are marked "cl". All dimensions in the bar lists are calculated and can be rounded off up to 5% by the ENGINEER.

COVER

Place the reinforcement so that the clear distance between face of concrete and nearest reinforcement is 4cm. for Φ 16 bars and smaller and 5cm. for Φ18 bars and larger, except provide a clear distance from face of concrete placed against earth or rock of 5cm. where member thickness is 22 cm. or less and 7.5 cm. where member thickness is greater than 22 cm, the clear distance being to the design dimension line reinforcement paralleling construction joints should have a minimum of 5cm. clear cover.

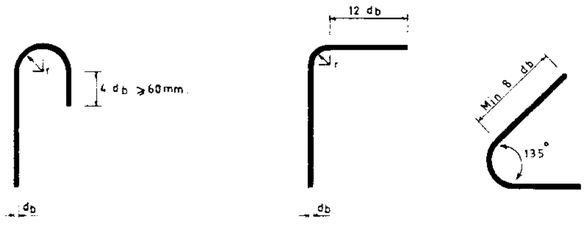
BENT BARS AND STANDARD HOOKS:

The minimum radius or bend measured on the insid of the bars for all reinforcement requiring bendeing and for standard hooks shall not be less than the values shown in the table:

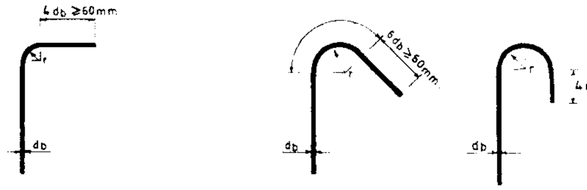
Minimum diameters of bend for standard hooks

	Bar diameter mm.	Minimum diameter Hook
Main Reinforcement	8 to 25	6 bar diameter
	26 to 32	8 bar diameter
Stirrups & tie hooks	8	40mm.
	10 to 12	50mm.
	14 to 16	65mm.

The minimum extensions of bars for standard hook are shown in the following figure:



(a) Main reinforcement



(b) Stirrups and ties

STANDARD HOOKS

REINFORCEMENT DOWELS:

Dowels may be indicated on the drawing thus Φ 14 (d) dowels shall have a min. embedment and projection equal to that required for lap splicing a bar of the same diameter.

PLACING:

Bars at small openings (max. 45cm.) in walls and slabs may be spread apart not more than 1½ times the bar spacing.

Reinforcement may be adjusted in the field to clear waterstops, keys, form ties, anchor bars, seals, recesses, embedded metalwork, and conduits except in heavily reinforced areas. In such cases relocation of the embedded materials must be considered. In no case should bars be bent to greater than 6 to 1 slope. Where possible, reinforcement shall be placed to maintain a clear distance of at least 2.5cm. between the reinforcement and anchor bolt, form ties, or other embedded metalwork.

Reinforcement parallel to anchor bolts or other embedded metalwork shall be place to maintain a clear distance of at least 1 times the max. size aggregate.

Reinforcement not to be placed between or within 10cm. of main power leads.

SPACING:

The first and last bars in slabs and walls, stirrups in beams, and ties in columns are to start and end at a maximum of one half of the adjacent bar spacing.

SPLICES:

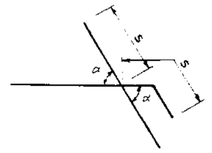
Unless otherwise shown the minimum length of lap for splicing parallel bars shall be 1.7 ld. ld shall be as given in table "A". When reinforcing bars of different size are to be spliced, the lap length shall be governed the smaller diameter bar. Splices are to be made so that the given distances to face of conc. will be manintained. The min. lap requirement "s" for non-parallel bars shall be as given in table "B".

TABLE "A"
Development lenght ld

db mm.	ld cm.
8 to 16	30
8 to 20	35
22	40
24	50
26	60
28	70
30	80
32	90
34	100

TABLE "B"
Lenghth of splice "s" for non-parallel bar

ANGLE	s
0 to 10	0.9 ld
10 to 30	1.0 ld
30 to 50	1.2 ld
50 to 65	1.4 ld
65 to 80	1.5 ld
80 to 90	1.7 ld.



Provide a hook if proper length cannot obtained by bending and extending bar.

ACCESSORIES:

Bar supports spacers and other accessories are not shown on the design dwgs. The recommendations of ACI 315_or other approved supporting systems my by used.

REFERENCE:

Unless otherwise shown follow the recommendations established by American concrete institutes.

BARS WITH VARIABLE UNIT LENGTH

Length quantities listed for variable bars are average length only. Exact length of bars shall be considered base on the structure dimensions.

LEAN CONCRETE

Lean concrete, its mixe design, thickness and method of appfication shall be determined by the Engineer based on project status and field conditions.

NOTES:

1. Maximum length of fence without a corner, end, gate, or brace post shall be 300 m
2. Additional brace posts shall be placed where directed by the engineer
3. Fence on curve shall have brace posts spaced as follows:
   - Curve radius less than 150 m, every 2nd post.
   - Curve radius 150–300 m, every 5th post.
   - Curve radius over 300 m, every 7th post.
   - All wood posts to be placed with butt end down. All wood posts to be placed in undisturbed natural ground or compacted fill.
   - Woven wire fencing sall have Nº 10 gage top and bottom wires with Nº 12½ gage intermediate and stay wires, spacing of stays shall be 30 cm.
   - Chain link fabric shall be attached to gate fromework in accordance with the manufacturers standard instructions.
4. This drawing has been prepared for wooden post. There is no restriction for other material such as angle iron steel pipe or concrete posts.

NOTES:

1. All pipe diameters shown are iron pipe sizes, standard weight.
2. Maximum interval between pull posts 60 m.
3. Barbed wire guard to be mounted vertically on all gate posts.
4. Chain link fabric shall be attached to fence framework in accordance with the manufacturer's standard instructions.
5. Barbed wire supporting arms shall be fabricated from 1½ inch pipe.
6. They shall be welded in place or otherwise secured to prevent rotation.
7. School safety fence 210 high. Urban safety fence 150 high.

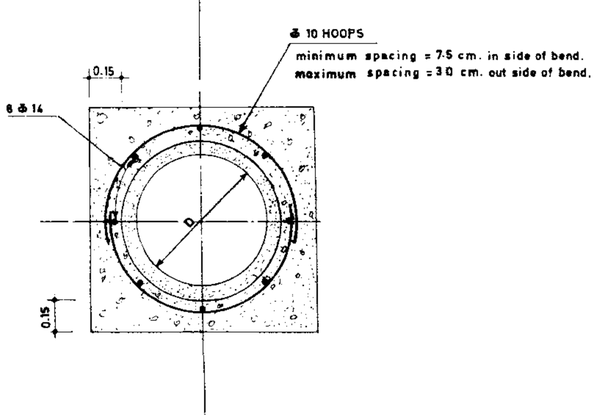
120	2.70	20			

NOTES:

1- Compact backfill to top of encasement at all bends.
2- Elevation of compacted backfill for bended mitered pipe bends shall be the same as the elevation of compacted backfill specified for the adjacent pipe.
3- Pipe extension shall be 45cm max. when D ≤ 90cm and max. $\frac{1}{2}$ D when D>90cm Min extension shall be 20 cm.



SECTION B-B
SC.1:20

CONCRETE PIPE PLACING TYPE I

$H \leqslant 3.00$m. for pipe group I

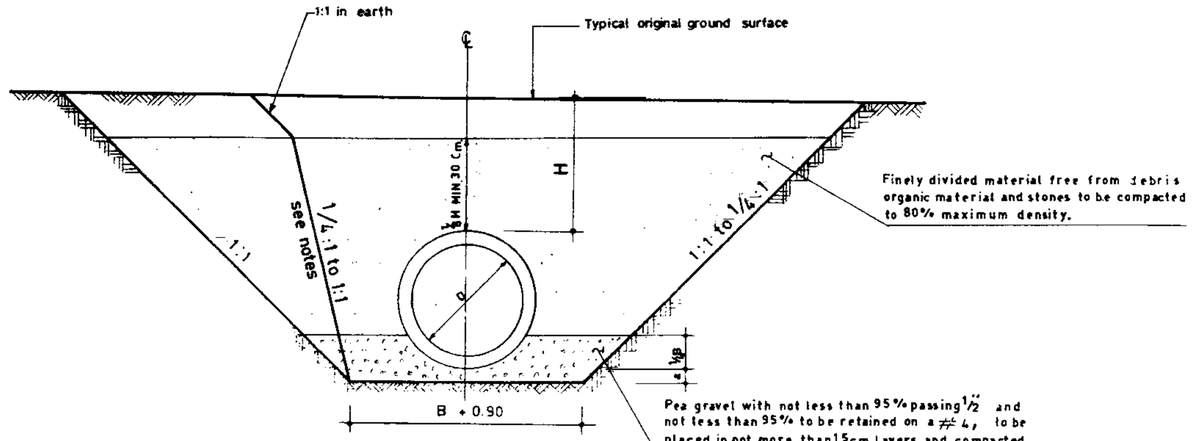
$H \leqslant 4.50$m. for pipe group II

$H \leqslant 6.00$m. for pipe group III

Minimum cover = 30 cm.

DEPTH OF BEDDING MATERIAL BELOW PIPE

D	a
60cm. and smaller	8 Cm.
70cm. to 140cm.	10 Cm.

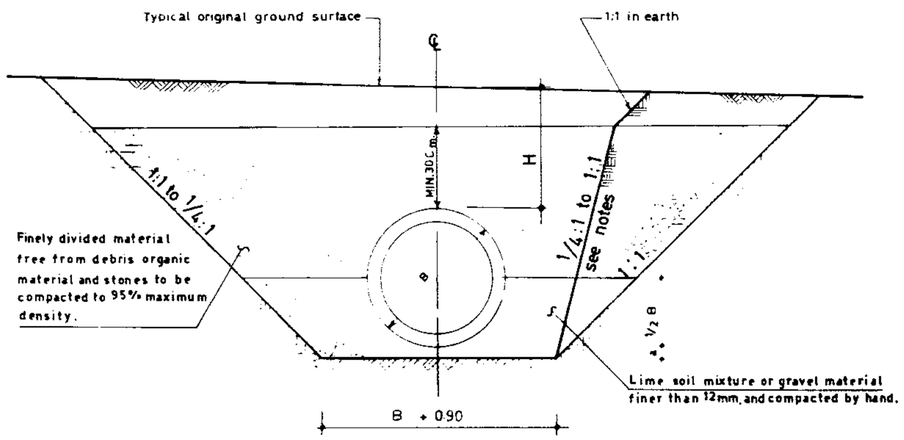


CONCRETE PIPE PLACING TYPE III

$H \leqslant 1.50$ for pipe group I

$H \leqslant 3.00$ for pipe group III

Minimum cover = 15 cm.



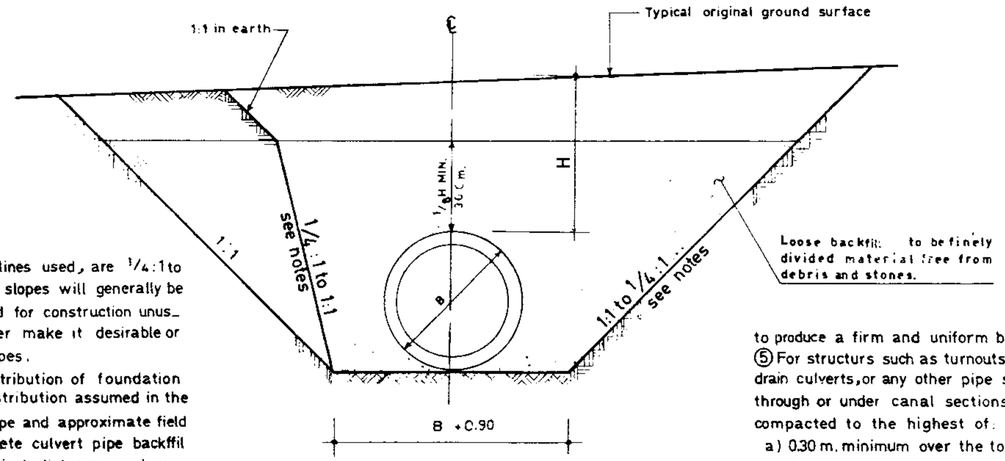
CONCRETE PIPE PLACING TYPE II

$H \leqslant 1.50$m. for pipe group I

$H \leqslant 3.00$m. for pipe group II

$H \leqslant 4.50$m. for pipe group III

Minimum cover = 30 cm.



CONCRETE PIPE PLACING TYPE IV

$H \leqslant 1.50$ for pipe group I

$H \leqslant 3.00$ " " " III

Minimum cover = 15 cm.

NOTES:

① Side slope excavation pay lines used, are 1/4:1 to 1:1. These temporay excavation slopes will generally be stable during the time required for construction unusual soil conditions may, however make it desirable or necessary to use flatter slopes.

② To be assured that the distribution of foundation pressures approximates the distribution assumed in the design of concrete pressure pipe and approximate field strength requirements of concrete culvert pipe backffil should be compacted to a vertical distance, as shown on this dwg.

③ In rock or other unsuitable foundation material the trench should be overexcavated to provide a compacted cushion of selected material to furnish a uniform bedding for the pipe.

④ For pipe which is to be placed within canal or roadway embankment, it is commonly required that the embankment material be placed to an elevation approximately one-fourth the diameter of the pipe above the prescribed pipe invert and then excavated carefully to produce a firm and uniform bedding for the pipe.

⑤ For structurs such as turnouts, drain inlets, cross drain culverts, or any other pipe structure which extends through or under canal sections, the backfill should be compacted to the highest of:

a) 0.30 m. minimum over the top of the pipe

b) Original ground surface, or

c) To top of compacted embankment if canal embankement has been compacted prior to construction of the pipe structure.

⑥ For rock or other incompressible materials, the trench should be overexcavated a min of 15cm. and refilled with granular material.

⑦ "D" and "B" are internal and external diam- respectivaly

⑧ "H" is the total fill on top of the pipe.

⑨ Type of pipe group as shown on dwg.t /02 to 17/2/1/04 shall be determind after "H" is found.

REFERENCE DWGS: For general notes see dwgs: 20/2/1/01 TO 20/2/1/03
For pipe group I see dwgs: 17/2/1/02
For pipe group II see dwgs: 17/2/1/03

DESIGN CONSIDERATIONS

1-1 General- (a) Usage- Baffled apron drops are used in canals or wasteway channels to provide dessipation of excess energy at drops in grade. Energy dissipation occurs as the water flows over the concrete baffle blocks which are located along the floor of the chute. The ability of the baffled apron drop to accommodate a widely fluctuating tailwater elevation makes it especially suitable as an energy dissipator at the end of a canal or wasteway that discharges into a reservoir. The length of the baffled apron does not affect the efficacy of the structure. It is effective in dissipating excess energy for drops of any magnitude, but it becomes uneconomical for large flows with great drops, due to the wide section and numerous blocks required. Where an excess of trash, trees, or tumbleweeds accompainies the flow, they may become lodged in the baffle blocks, restricting the flow. Removal of this material is sometimes difficult.

(b) Inlet Control Features- Various types of inlet control features are utilized to maintain an upstream water surface as required for turnouts; or to provide velocity of approach consistent with the scouring tolerance of the upstream section· or to avoid the excessive splashing that would result from supercritical flow at the inlet. The more common types of inlet control features are as follows:

(b-1) Sill control- A sill may be provided at the inlet, as shown in figure 1-A, to reduce the velocity of approach , and minimize scour in the upstream section. The sill also provides a controlled water surface for upstream turnouts. To permit complete drainage of the upstream pool, a slot is provided through the crest, as shown in figure (2-A). The inlet should be kept free of sediment deposits, as the extensive accumulation of sediment would allow the flow to sweep over the sill at a velocity too fast for effective dissipation of energy.

(b-2) Control notch- A control notch may be provided at the inlet, as shown in figure 1-B, to control the upstream water depth. While the control notch is designed to maintain normal depth and velocity in the upstream section, it produces a fast velocity in the inlet itself, causing splashing as the fast velocity flow strikes the first row of baffle blocks. Excessive splashing may require frequent maintenance of the erosion protection. The control notch should be kept free of trash.

(b-3) Inlet without control- The simplest type of inlet (shown in fig. 1C) is used where there is not a requirement to control the upstream water surface for turnout deliveries, and where the upstream channel is sufficiently stable to withstand (without erosion) the higher velocities associated with water surface drawdown. To minimize splashing as the flow strikes the first row of baffle blocks, an invert curve may be provided to allow the flow to strike the blocks in a direction normal to their upstream face. Where flows are infrequent, and some splashing is permissible, the curve is sometimes omitted, as shown in figure 1B.

(C) Miscellaneous Features.-

(C-1) Bridge deck,- Where a crossing is required, a bridge deck may be incorporated in the inlet design.

(C-2) Cutoff walls and wingwalls.- In addition to the inlet cutoff walls, wingwalls are provided at, or near the downstream end of the structure, to decrease percolation and to retain the backfill along the slope. Where the downstream channel is subject to degradation, a cutoff wall is extended down from the invert, as shown in figure (2-B). The wingwalls may be located at the end of the structure to coincide with the cutoff, but they are often located a few meter upstream from the end. This provides a better stilling action at the outlet, and raises the top elevation of the wingwall, which should be located above the tailwater elevation to minimize erosion

(C-3) Protective drains.- Protective drains are sometimes provided under the invert of the baffled apron drop to relieve the uplift pressure following the termination of flow.

1-2 Design Considerations.- (a) Capacity.- The capacity of the baffled apron drop is a function of the allowable discharge, q, per m. of width, as shown in table 1. They have been operated for short periods at about twice the design capacity without excessive erosion.

(b) Inlet.- The inlet should be the same width as the baffled apron, and should provide a velocity of approach slower than the critical velocity, V_c. Where splashing must be minimized , the entrance velocity should not exceed about $\frac{V_c}{2}$, where

$$V_c = \sqrt[3]{qq}$$

in the rectangular inlet section. Other design considerations are as follows:

(b-1) Sill control.- The inlet length should be at least $2d_1$, as shown in figure 1A. The required height of the sill above the inlet floor may be determined from the energy balance between the inlet and the upstream channel.

Thus,

$$E_{s1} = E_{sc} + h_i + h_s$$

or

$$h_s = E_{s1} - E_{sc} - h_i$$

where

h_s is the sill height,

$E_{s1} = d_1 + h_{v1}$ in the upstream channel,

$E_{sc} = d_c + h_{vc}$ in the control section at the sill,

and

$$h_i = 0.5\Delta h_v = 0.5(h_{vc} - h_{v1}) = 0.5\left[\frac{V_c^2}{2g} - \frac{V_1^2}{2g}\right]$$

The curvature of the sill crest should terminate at its point of tangency with the slope of the downstream apron. This point should not be more than 0.30 m in elevation below the crest. This is assured by limiting the radius of curvature to a maximum of 2.7 m. A 1.80 m radius is frequently used. The sill has a 15 cm-wide slot to provide drainage of the upstream pool.

(b-2) Control notch.- A control notch, where used should conform to the design requirements of dwg No. 12/5/2/01. The rectangular inlet section should begin 1.5 m upstream from the control notch, and the length between the notch and the sill should be equal to three times the upstream water depth, as shown in figure 1B, to permit the flow to spread to the full width of the section.

(c) Baffled Apron Dimensions (see fig.2).- The following steps are suggested as a guide to be used in setting the dimensions :

(c-1) Set the longitudinal slope of the chute floor and sidewalls at 2 to 1 (tan ø = 0.5).

(c-2) Approximate width of structure should be set by the relation $B = \frac{Q}{q}$

@omoorepeyman.ir

For the permissible entrance velocity, see design Consideration part "b".

(c_3) Set the first row of baffles so that the base of the upstream face is at the downstream end of the invert curve and no more than 0.30 m in elevation below the crest.

(c_4) Baffle block height, h_b should be about 0.9 times critical depth, d_c, to nearest cm.

(c_5) Baffle block widths and spaces should be equal, and not less than h_b, but not more than 1-1/2 h_b. Partial blocks, having a width not less than 1/3 h_b and not more than 2/3 h_b should be placed against the sidewalls in rows 1,3,5,7, etc. Alternate rows of baffle blocks should be staggered so that each block is downstream from a space in the adjacent row. The structure width, B, determined above, should be adjusted so convenient baffle block widths can be used.

(c_6) The slope distance, s, between rows of baffle blocks, as shown in fig. 2 , should be at least 2 h_b, but no greater than 1.8m.

A spacing of 1.80m may be used for all blocks equal to or less than 0.90 m in height.

(c_7) A minimum of four rows of baffle blocks should be used. The baffled apron should be extended so that the top of at least one row of baffle blocks will be below the bottom grade of the outlet channel as discussed in subsection (1_2)-(c_3). The apron should be extended beyond the last row of blocks a distance equal to the clear space between block rows.

(c_8) Baffle blocks are constructed with their upstream faces normal to the chute floor. The longitudinal thickness, T, of the baffle blocks at the top should be at least 0.20 m, but not more than 0.25 m. See block detail, figure 2_C.

(c_9) Suggested height of the walls to provide adequate freeboard is three times the baffle block height measured normal to the chute floor. It is generally not feasible to set the freeboard for these structures to contain all of the spray and splash.

(d) Uplift Stability.- The net force causing flotation of the structure should be considered, assuming a sudden cessation of flow in the channel. The net flotation force is equal to the weight of the empty structure minus the hydrostatic force remaining in the soil around the structure. The magnitude of the maximum hydrostatic force, or uplift pressure varies with the theoretical height of the percolation gradient as determined by Lane's weighted-creep method, assuming an upstream gradient at the normal water surface elevation.

(e) Sliding Stability.-

(e_1) Long baffled apron drops.- The slope stability or tendency of long baffled aprons to slide down the 2 to 1 slope should be checked. This is particularly important in channels where erosion may remove the earth material at the downstream toe of the apron.

(e_2) Short baffled apron drops.- Short baffled apron drops also should be checked for sliding. Complete removal by erosion of the earth material downstream from the downstream cutoff walls should be assumed, unless the stability of the downstream channel is assured. A horizontal sliding plane should be assumed rather than the sloping plane assumed for long baffled apron drops.

If the forces tending to induce sliding are greater than the forces resisting sliding (using suitable safety factors), additional cutoff walls should be included.

(f) Miscellaneous Considerations.-

(f_1) Gravel or riprap should be provided on each side of the structure from the top of the slope to the downstream wingwall, extending laterally a distance equal to the wall height. This protection above the maximum downstream water surface is to prevent erosion from splashing. Below this water surface the protection is required to prevent erosion by eddy current. Wingwalls hold the slope protection in place.

(f_2) The channel grade may be controlled by a downstream structure, by geologic formation, or by being on a stable slope for the design capacity. A slope of 0.0018 will usually be stable for storm waterflows, but for normal canal flows the assumed slope should be no steeper than that of a canal in the same material.

The bottom row of blocks should be set below the computed channel invert elevation. When scour has occured, to provide for future storms, the apron and walls should be extended by exposing the reinforcement in the end of the structure and bonding a new extension to the original installation

			TECHNICAL RESEARCH AND STANDARDS BUREAU

DESIGN EXAMPLE

A wasteway channel descends a slope that requires energy dessipation to prevent excessive erosion. As a dependable tailwater cannot be assured, it is decided that a baffled apron drop would best meet the need.

a) Assumptions.-

(a-1) On the basis of soil type and operating conditions it is decided that little splashing should be permitted, and a sill-type control is preferable (see fig. 1A).

(a-2) Hydraulic properties of the wasteway channel are as follows:

$Q = 3.240\ m^3/s$

$b = 2.40\ m$ | $n = 0.025$

$d_1 = 1.225\ m$ | $s = 0.00035$

$A_1 = 5.192\ m^2$ | ss = 1-1/2:1

$f_b \simeq 0.60\ m$

$v_1 = 0.624\ m/s$

$h_v = 0.02\ m$ | $h_B = 1.225+0.60=1.825 \simeq 1.85m$

(a-3) A drop of 1.80 m in invert elevation is required.

b) Solution (see fig. 2 for dimension nomenclature).-

(b-1) From table 1, find the recommended discharge per m., q, for a total capacity of 3.24 m^3/s, and determine a preliminary chute width.

For

$$Q = 3.24\ m^3/s$$

find by interpolation

$$q = 1.50\ m^3/s \text{ (approximately)}.$$

Then

$$B = \frac{Q}{q} = \frac{3.24}{1.50} = 2.16\ m.$$

(b-2) Determine the limits of baffle block dimensions, based upon critical depth, d_c.

Ref to publication #104

Let $K'_c = \frac{Q}{B^{5/2}} = \frac{3.24}{(2.2)^{5/2}} = .4513$

Read $\frac{y_c}{b}$ Coresponding to the calculated K'_c

Under colum 0

From table B-2,3 of the same publication $\frac{y_c}{b} = .275$

Y_c refers to dc and b refers to B

Then: $dc = 0.275 \times 2.2 = 0.605 \simeq 0.61\ m$

Block height, $h_b = 0.9 \times d_c - 0.549 \simeq 0.55m$

Block width and space, w:

Min. $w = h_b = 0.55\ m$, Max. $w = 1.5\ h_b = 1.5 \times 0.55 = 0.825$

(b-3) Determine exace dimensions of baffle blocks and chute width. As the partial block width

$w_p = \frac{1}{3} h_b$ min= 0.183 min.,

and $\frac{2}{3} h_b$ max.=0.366 max.,

Try $w_p = \frac{1}{2} h_b$. for simplicity.= $0.275 \simeq 0.28m$

Then, use alternate rows as follows:

Rows 1 and 3:

1 full block =1w

2 full spaces=2w

2 half blocks=1w

B=4w

Rows 2 and 4:

2 full blockes =2w

1 full space =1w

2 half spaces =1w

B =4w

Thus, the total width, B, of any row is

B =4w

Using the minimum block width of 0.55m.

B= 4x0.55= 2.20 m

To simplify dimensions, use

w =0.60m $> 0.55 <0.825$.

and

w_p=0.30m $> 0.183 < 0.366$.

Then,

B = 4w = 4x0.60 = 2.40m.

$q = \frac{3.24}{2.40} = 1.35\ m^3/s$.

by use the same method using publication #104

$d_c = 0.571$ m.

$h_b = 0.9 \times 0.571 = 0.514$ m.

Use

$h_b = 0.52m$

Select T= 0.22m(see block detail, fig.(2-c)

inorder $0.20m < T < 0.25m$

(b-4) Determine inlet length, L_1:

$L_1 = 2d_1 = 2 \times 1.225 = 2.45$ m.

(b-5) Determine inlet sill height h_s,

using B=2.40m., g = 1.35 m^3/s,

$d_c = 0.571$,

$h_{v_c} = 0.285$, and $V_c = 2.364$ m/s

Then

$h_s = E_{s1} - E_{s_c} - h_i$ (where h_i=inlet loss)

$$h_s = (d_1 + h_{v_1}) - (d_c + h_{v_c}) - 0.5(h_{v_c} - h_{v_1})$$

$$= (1.225+0.02) - (0.571+0.285) - 0.50(0.285-0.02)$$

$$= 0.255\ m.$$

(b-6) Check inlet velocity to minimize splashing:

Determine depth, d_1, at inlet cutoff:

$$d_1 = h_s + d_c + h_{v_c}$$

$$= h_s + d_c + \frac{d_c}{2}$$

$$= 0.255 + 0.571 + 0.285$$

$$= 1.111$$

The entrance velocity is then,

$$V_1 = \frac{Q}{A_1} = \frac{Q}{d_1 B} = \frac{3.24}{1.111 \times 2.40} = 1.215\ m/s$$

Determine critical velocity, V_c over crest:

$$V_c = \frac{Q}{A} = \frac{3.24}{d_c B} = \frac{3.24}{0.572 \times 2.4} = 2.364\ m/s$$

Thus, the inlet velocity is approximately equal to half the critical velocity, and splashing will be minimized.

(b-7) Determine sill length, L_2, and dimension e, as shown in fig. 3.

Using a radius, R = 1.80m, and an invert slope of 2 to 1,

$\phi = 26^o34'$

$\sin \phi = 0.4472 = y/z$

$\tan \phi = 0.5 = y/x$

$\phi/2 = 13^o17'$

$\tan\phi/2 = 0.2361 = z/R$

Substituting,

$z = 0.2361R = 0.425$ m.

$y = 0.4472z = 0.190$ m.

$x = \frac{y}{0.5} = 0.380$ m.

Then,

$L_2 = x + z = 0.380 + 0.425 = 0.805$ m.

and

$e = h_s - y = 0.225 - 0.190 = 0.065$ m.

(b-8) Determine the slope distance, S, between rows of baffle blocks, as shown in fig.(2-B)

$S = 2\ h_b$ min.

$= 2(0.52) = 1.04$ m.

Use

S = 1.80 m (see subsec. (1-2)-(c-6)

(b-9) Determine minimum depth of cover, j, at outlet to insure that the last row of baffle blocks will be covered bv the backfill, placed in the structure to the elevation of the downstream grade.

$S_y = S \sin \phi = 1.80(0.4472) = 0.805$ m.

$h_y = h_b \cos \phi = 0.52(0.8944) = 0.465$ m.

$j = S_y + h_y = 1.270$ m.

(b-10) Determine apron lengths, L_3 and L_s for a drop, F = 1.80 m.

Minimum distance,

$L_y = e + F + j$

$= 0.065 + 1.80 + 1.270 = 3.135$ m.

Minimum rows of blocks:

$$\text{Rows} = \frac{L_y}{S_y} = \frac{3.135}{0.805} = 3.89$$

Use 4 rows.

Where the ratio, $\frac{L_y}{S_y}$ indicates that fewer rows would be adequate the minimum number of four rows should be used by extending two or more rows below the donwstream grade.

Finally,

$L_s = 4\ S$

$= 4(1.80) = 7.20$ m.

$L_y = 4\ S_y$

$= 4(0.805) = 3.22$ m.

$L_3 = 4\ S_x$

$= 4(1.80 \cos\phi) = 6.440$ m.

(b-11) Determine overall length of structure.

$L = L_1 + L_2 + L_3$

$= 2.45 + 0.805 + 6.440$

$= 9.70$ m.

(b-12) Determine the following wall heights (see fig(2-b)

$h_1 = d_1 + 0.30m = 1.225 + 0.30 = 1.525m$

With a level invert, and with the top of the walls level from h_1 to h_2,

$h_2 = h_1 - h_s$

$= 1.525 - 0.255$

$= 1.270$ m.

The height of the chute walls,

$$h_3 = 3\,h_b = 3(0.52) = 1.56 \text{ m.}$$

(b_13) Determine length, M_1, of the upstream wingwalls, as shown in fig. 4.

$$M_1 = 1.5\,h_1 + C_1,$$

Where the cutoff depth, $C_1 = 0.75$ for a water depth,

$$d_1 = 1.225 \text{ m. (see dwg No.13/6/1/01}$$

Then,

$$M_1 = 1.5(1.525) + 0.75$$
$$= 3.04 \text{ m.}$$

(b_14) Determine length, M_3, of downstream wingwalls, as shown in fig. 5.

$$M_3 = 1.5\,h_3' + C_3,$$

Where the cutoff depth, $C_3 = 0.75$ m. for an assumed channel water depth of 1.22 m.

$$h_3' = \frac{h_3}{\cos \phi} \quad (\text{with } \phi = 26^{\circ}34')$$

$$= \frac{1.56}{0.8944}$$

$$= 1.74 \text{ m.}$$

Then

$$M_3 = 1.5(1.74) + 0.75$$

$$= 3.36$$

(b_15) Check flotation of the structure (due to uplift forces) according to the requirements of subsection 1-2 (d).

(b_16) Check sliding stability of the structure according to the requirements of subsection 1-2 (c).

(b_17) Determine protection requirements. Select type of protection from dwg. No. 13/4/1/01 for inclined drops with a water depth of 1.225 m.

Inlet Protection: Type 1, extending a distance d_1 upstream, and up the sloping sides to an elevation 0.30 m. above the normal water surface.

Slope Protection: Type 1, as described in subsection 1-2(f).

Outlet Protection: Type 3, extending downstream a distance $4d_1$, and up the sloping sides to an elevation 0.3 m. above the assumed water surface, or to top of constructed bank, whichever is greater. Note that the backfill, placed over the last row of blocks, covers the riprap to the elevation of the natural grade (see fig. 2_b)

(b_18) Check percolation, by the requirement and provide cutoff walls if needed.

NOTES:

1. Baffled oulet are used at the end of the pipe drops, pipe chutes, and pipe crass drainage culverts or anywhere that the excess energy of the incoming water jet must be dissipated.
2. A tail water depth is not required for satisfactory hydraulic performance as is the case for a hydraulic jump basin.
3. For the best operation, the tailwater should be about ($H_{4/2}+E_1$) above the invert of the baffled outlet. The height of tailwate above the baffed outlet invert should never exceed (H_4+E_1).
4. If the tailwater depth is uncontrolled, the baffled outlet invert is usually a distance (E_1) below the downstream channal invert.
5. Because the baffled outlet does not require tailwater, this outlet is therefore particulary useful where tailwater depth is uncontrolled or where the rate of discharge increase is sudden and the tailwater buildup is slow
6. If the entrance pipe slopes downward, the outlet end of the pipe should be turned horizontal for a length of at least 3 pipe diameters.
7. Because there is no practical method of making the basin self_cleaning of debris, where debris is a problem, other types of energy dissipators should be used.
8. Protection with a well_graded mixture of rocks most having diameters equal to one_twentieth of the basin width should be placed to a depth equal to the height of the end sill for distance equal to one basin width downstream from the end sill.

PROCEDURE FOR SELECTING THE STRUCTURE

1 _ Define discharge (Q in m^3/s) & head (h in meter).

2 _ Compute theoretical velocity $V=\sqrt{2gh}$ in m/s if $V > 15$ m/s Baffled out let is not Recommended

3 _ Select pipe Dia. $D=0.6\sqrt{Q}$ assume max.velcocity. 3.5 m/s when pipe flowing full :

4 _ Determine basin dimensions:

4_1 calculate depth of flow entering the basin $d=\sqrt{\frac{Q}{V}}$

4_2 calculate Froude number $F=\frac{V}{\sqrt{gd}}$

4_3 read ratio $\frac{W}{d}$ against the calculated F from the graph:

4_4 $W=d\times(\frac{W}{d})$

5 _ Select the structure which it's W is close enough to calculated W :

SELECTING REINFORCEMENT DWG.

GROUP Nº	STR. Nº	DWG.Nº
1	100 to 220	16/1/3/01
2	240	16/1/3/02
3	260 to 280	16/1/3/03
4	300	16/1/3/04
5	320 to 340	16/1/3/05
6	360 to 400	16/1/3/06

EXAMPLE:

1 $Q=1.2$ m/s. & $h=8.3$ m.

2 _ $V=\sqrt{2\times9.81\times8.3}=12.76$ m/s.

3 _ $D=0.6\sqrt{1.2}=.657$ m.

Selected : D = 700 m.m.

4_1 $d=\sqrt{\frac{1.2}{12.76}}=0.307$ m.

4_2 $F=\frac{12.76}{\sqrt{9.81\times0.307}}=7.35$

4_3 From the graph $\frac{W}{d}=8.9$

4_4 $W=0.307\times809=2.732$ m.

5 _ Structure Nº. 280 which it's W = 2.80 m. is selected.

6 _ Use dwg. Nº. 16/1/3/03 for reinforcement.

SELECTING RECTANGULAR WEIR STRUCTURE & CALCULATING REQUIRED DIMENSIONS AND WEIR SETTING.

STEP 1: Collect the following data:

- Q in m^3/s
- Canal wide (b)
- Normal water depth at upstream Y_1
- Normal water depth at downstream Y_2
- Available drop between upstream & downstream of water surfaces ΔH
- Upstream canal invert elevation EL.A
- Downstream canal invert elevation EL.E

STEP 2: If $Q \leq 0.52$ then select the structure having the least weir lenght for Qmax which can be adopted to available drop from standard Dimension table, then read dimensions W, L, H, H' b_1, k, e & T; GOTO step3 otherwise: From general data table select the structure having the least weir lenght for Qmax which can be adopted to availabue drop, then read W

STEP 3: From Rectangular weir table at appendix A of publication No. 106 read the value of head (h) corresponding to the given Q

From the Anchor Bold & weir blade Data, read the value of G

STEP 4: $b_1 = 1.5\,W$

EL.B = EL.A + Y_1 − 2h − h

EL.C = EL.B + 2h + G − .05

Not: if $2h < 0.30$m Then use $2h = 0.30$m

IF $Q < 0.52$ m/s then goto Step 7. otherwise:

EL.D = EL.A + Y_1 − (ΔH) − Y_2 + 0.15

H = EL.C − EL.D

H' = 0.15 + Y_2 + Structure freeboard

L = 3h + 2F

STEP 5: From the following table select the cutoff depth and then calculate Kmin.

3h (m)	cut off depth (m)	cut off thickness (m)
0 – 0.90	0.60	0.15
90–1.80	0.75	0.20
> 1.80	0.90	0.20

K = Cut off depth − (EL.B − EL.D)

STEP 6: Calculate weighted creep lenght (W.C.L) by lane method.

W.C.L = (EL.B − EL.D) + K + 2(K − 0.15) + (K − Protection thickness)

Calculate (ΔWS) for upstream water ponded to weir crest and downstream water at canal invert $\Delta WS = (EL.B + 2h) - (EL.D + .15)$ percolation factor = W.C.L / Δ WS

IF calculated percolation > recommended percolation factor GOTO Step 8. otherwise increase K and goto Step 6

STEP 7: EL.D = EL.C − H

t = 0.15 m

STEP 8: $T = b_1 + 3(2h + G - 0.05) + 2K$

STEP 9: Use Anchor Bolt and weir blade Data from the corresponding tables.

SELECTING CIPOLLETTI WEIR STRUCTURE & CALCULATING REQUIRED DIMENSIONS AND WEIR SETTING.

STEP 1: Collect the following data.

- Q in m^3/s
- Canal wide (b)
- Normal water depth at upstream Y_1
- Normal water depth at downstream Y_2
- Available drop between upstream & downstream of water surfaces ΔH
- Upstream canal invert elevation EL.A
- Downstream canal invert elevation EL.E

STEP 2: If $Q \leq 0.52$ then select the structure having the least weir lenght for Qmax which can be adapted to available drop from standard Dimension table, then read dimensions W, L, H, H' b_1, k, e & T: GOTO step3 otherwise: From general data table select the structure having the least weir lenght for Qmax which can be adapted to available drop then read W

STEP 3: From Rectangular weir table at apperdix A of publication No. 106 read the value of head (h) corresponding to the given Q

From the Anchor bolt & weir blade Data, read the value of G

STEP 4: $b_1 = 1.5\,W$

EL.B = EL.A + y_1 − 2h − h

EL.C = EL.B + 2h + G − .05

Not: if $2h < 0.30$m Then use $2h = 0.30$m

IF $Q \leq 0.52$ m/s then goto Step 7 otherwise

EL.D = EL.A + y_1 − (ΔH) − y_2 + 0.15

H = EL.C − EL.D

H' = 0.15 + y_2 + Structure freeboard

L = 3h + 2F

STEP 5: From the following table select the cutoff depth and then calculate Kmin

3h (m)	cut off depth (m)	cut off thickness (m)
0 – 0.90	0.60	0.15
90–1.80	0.75	0.20
> 1.80	0.90	0.20

K = Cut off depth − (EL.B − EL.D)

STEP 6: Calculate weighted creep lenght (W.C.L) by lane method

W.C.L = (EL.B − EL.D) + K + 2(K − 0.15) + (K − Protection thickness)

Calculate (ΔWS) for upstream water ponded to weir crest and downstream water at canal invert $\Delta WS = (EL.B + 2h) - (EL.D + .15)$ percolation factor = W.C.L / Δ WS

IF calculated percolation > recommended percolation factor GOTO Step 8, otherwise increase K and goto Step 6

STEP 7: EL.D = EL.C − H

t = 0.15 m

STEP 8: $T = b_1 + 3(2h + G - 0.05) + 2K$

STEP 9: Use Anchor Bolt and weir blade Data from the corresponding tables.

DETAIL „A"
Scale 1:20

NOTES:

1. For selecting a proper parshall flumes refer to PBO publication № 106 .
2. For hydralic properties and design example refer to PBO publication № 106 .
3. Parshall flums with a throat width less than one foot must be constructed with iron or other types of suitable metals.

SECTION A-A

NOTES

(1) Culvert, as discussed in this publication, carries storm runoff or drainage water, under the canal.

(2) Precast concrete pipe is the usual choice for culverts under canals.

(3) Where the conduit is on a uniform grade it has been found satisfactory to use a minimum slope of 0.005 and a maximum slope, slightly steeper than the critical slope.

(4) Where a uniform slope would greatly exceed the critical slope, requring an energy dissipator, it is usually preferable to include a vertical bend and two invert slopes, S_1 and S_2 the upstream slope, S_1, should be much steeper than critical and the downstream slope S_2 is usually set on the flat slope of 0.005 to facilitate dissipation of excess energy by a hydraulic jump in the pipe.

(5) Type 1, 2, 3 and 4 of transitions (Dwgs. Nº. 13/6/1/01, 13/7/1/01, 13/8/1/01, 13/9/1/01) are used as culvert inlets. The best choice for any particular situations is dependent upon the hydraulics the topographic character of the site, and the relative elevations of the canal and drainage.

(6) The culvert outlet performs the basic function of releasing water to outlet channel without excessive erosion. Excess energy may be dissipate by a concrete transition, baffled outlet (Dwg Nº. 16/1/1/01) baffled apron drop (Dwg Nº. 16/2/2/01). The type 1 and 2 of concrete outlet transitions are used at culvert outlets.

(7) Generally, culverts are sized on the basis of storm runoff for a 25 year flood frequency.

(8) The culvert should be designed for a maximum full pipe velocity of:

- 3 m^3/sec if a concrete transition is used at the outlet.
- 3.5 m^3/sec if an energy dissipator is used.

(9) For pipe flowing full the pipe diameter is determined from the equation $Q = A.V.$ or $D = 1.13\sqrt{\frac{Q}{V}}$

(10) The minimum diameter usually permitted for pipe culvert is 60 cm.

(11) The upstream water surface will be controlled by the head:

a- Inlet control: That is when the upstream water surface is not influenced by flow conditions downstream from the inlet.

b- Outlet control: That is when upstream water surface is influenced by downstream conditions.

(12) The need for energy dissipation structures at culvert outlets should be avoided if possible, but if the exit velocity in the pipe exceeds 6.0 m/s, some kind of energy dissipator such as baffled outlet, drops, chuts, etc. should be provided.

(13) Standard outlet protection is used if the pipe velocity at the outlet is equal to or less than 5 m/sec and the next higher class of protection is required if the pipe velocity at the outlet is greater than 5 m/sec.

REFERENCE DWGS: For pipe connection to structure see dwg Nº 17/1/1/01 TO 17/1/1/03
For general notes see dwg Nº 20/2/1/01 TO 20/2/1/03

NOTES:

① These types of head walls could be used at the culvert ends under compacted fills in place of transitions type ① to ⑤ or inlet and outlet transitions.

② "D" designated as diameter of opening.

③ To select headwall:
a) define D for pipe culvert's current section with respect to hydraulic criteria discussed on dwg. N° 11/6/1/02 and other field conditions.
b) select the suitable headwall which fits the required "D" value, from dimension table.

REFERENCE DWGS, For head wall reinforcement see dwg. N° 14/1/3/01
For pipe connection to structure see dwgs.17/1/1/01 TO 17/1/1/03
For general notes see dwgs. N° 20/2/1/01 To 20/2/1/03

STRUCTURE DESCRIPTION

Side spillway is a protective structure which protect the canal system and adjacent property from damage, which would result from uncontrolled storm runoff or drainage water, or an uncontrolled excess of flow within the canal. Side spillway and its wasteway, is also used to empty the canal for inspection, maintenance, seasonal shutdown or an emergency such as a canal bank failure.

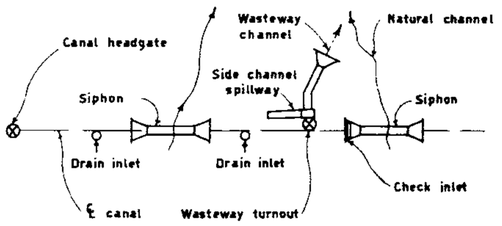
STRUCTURE COMPONENTS

Side spillway consists of the following hydraulic elements:

- Wasteway inlet which is usually an overflow structure.
- Wasteway turnout gate for drainage of the canal.
- Pool
- Pipe
- Transition
- Wasteway channel

APPLICATION

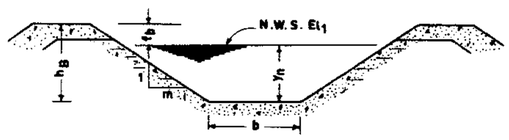
Side channel spillway are located along the canal bank with the spillway crest parallel to the canal alinement. As the canal water surface rises above the crest, the excess water is automatically discharged into a side channel. This structure is used in conjuction with a slide gate which provides for complete drainage of the canal. The following plan shows the location of entring excess water into the canal as well as the location of side spillway channel.



DESIGN PROCEDURE

Step 1

Collect the hydraulic properties of the canal which a side channel spillway is subject to design.



let:

Q_1 = Canal flow (m^3/s)

y_n = Canal normal water depth (m.)

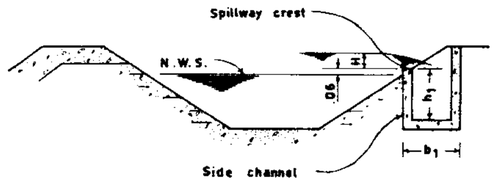
f_b = Canal freeboard as shown (m.)

Q_2 = The excess flow subject to be spilled (m^3/s)

El_1 = Elevation of normal water surface

Step 2

Set spillway crest, calculate required head and crest length.



2-1 Set spillway crest 0.06 m. above NWS.

2-2 Calculate maximum head (H) on the spillway crest allowing 50% encroachment on normal canal bank freeboard.

$$H = 0.5\, f_b - 0.06$$

2-3 Calculate required crest length (L_c) from the standard suppressed rectangular weir formula for the excess water (Q_2)

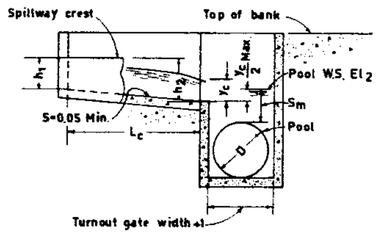
$$L_c = \frac{Q_2}{1.838\, H^{1.5}}$$

Step 3

Design side channel:

Side channel has a rectangular cross section. The width, depth and slope should be adequate to provide freeflow while carrying weed, trash or ice load.

A reasonable width should vary uniformly from 0.6 m. at the upstream end to 1.2 m. at the downstream end, except that a downstream width of 0.9 m. is sufficient for discharge less than 1.4 m^3/s



Set: Upstream end bottom width = $b_1 = 0.60$ m.
and, downstream end bottom width = $b_2 = 1.20$ m.
if $Q_2 \leq 1.4$ m^3/s set: $b_2 = 0.90$ m.

let:

q_2 = Unit flow at the downstream end.

y_c = Critical water depth at the downstrean end.

then:

$$q_2 = \frac{Q_2}{b_2} \qquad h_2 = 1.5\, y_c + 0.3$$

$$y_c = 0.467\, q_2^{2/3} \qquad h_1 = h_2 - 0.05\, L_c$$

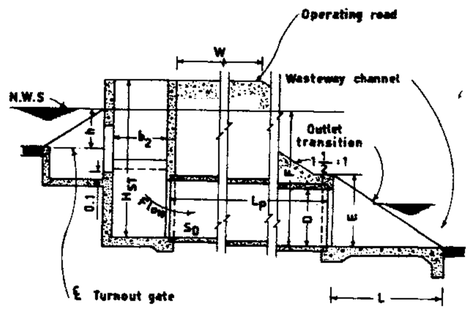
TECHNICAL RESEARCH AND STANDARD BUREAU

@omoorepeyman.ir

Step 4

4-1 Determine wasteway turnout gate size and head for normal canal flow (Q_1)



let:

V = Max. gate velocity (m/s): Max. 3 m/s

A_g= Gate area (m^2)

h = Gate head (m)

Set the centerline of gate at canal invert elevation; so: $h = y_n$

then,

$$V = C\sqrt{2gh} \qquad \text{where: } C=0.6$$

if $V \leq 3$ m/s then $A=\frac{Q_1}{V}$ goto 4.2

otherwise set: V = 3 m/s then,

$$A_g = \frac{Q_1}{V} \quad \text{and} \quad h = \frac{Q_1^2}{2g A^2 C^2}$$

4-2 Select the gate size based on A,h from the standard gates.

Step 5

Set elevation of pool water surface.

let:

El_2 = Elevation of pool water surface.

Calculate El_2:

$$El_2 = El_1 + 0.06 - h_1 - 0.05L_c + 0.5y_c$$

Or:

$$El_2 = El_1 - h$$

Select whichever resulted lower pool water surface

Step 6

Determine pipe diameter and crown submergence for the normal canal capacity (Q_1) plus the excess water (Q_2):

$$Q_3 = Q_1 + Q_2$$

set pipe velocity, $V_p = 3$ m/s

Pipe area: $A_p = \frac{Q_3}{V_p}$

Calculated pipe dia. : $D_1 = \sqrt{\frac{4A}{\pi}}$

Select pipe diameter (D) from the standard pipes (D).

Recalculate : $A_p = \frac{\pi D^2}{4}$

$$V_p = \frac{Q_3}{A_p}$$

$$h_{V_p} = \frac{V_p^2}{2g}$$

6-1 Set pipe crown 1.5 h_{V_p} below the pool water surface.

6-2 Submergence, $S_m = 1.5\ h_{V_p}$

6-3 Set pipe invert on a slope of $S_0 = .001$

Step 7

Find structure height (H_{ST})

$$H_{ST} = D + S_m + (El_1 - El_2) + f_b$$

Step 8

Select outlet transition type 2 and read E and L base on the selected pipe diameter.

Step 9

Determine pipe length (L_p)

let:

W = Width of operating road.

$L_p = W + 1.5(H_{ST} - E) + 0.3$

Step 10

Select type of protection for inlet and outlet.

Step 11

Check the percolation path.

Step 12

Check the effect of downstream water surface to pipe hydraulic properties.

12-1 Collect the hydraulic properties of wasteway channel.

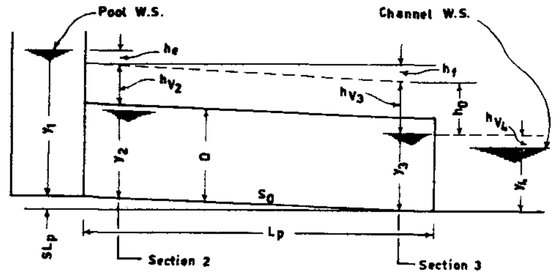
let:

Q_{max} = Wasteway channel flow=$Q_1+Q_2 = Q_3$

Y_4 = Depth of water for Q_{max}

V_4 = Wasteway water velocity

h_{V_4} = Velocity head = $\frac{V_4^2}{2g}$



12-2 Calculate specific energy in wasteway channel:

$$E_4 = d_4 + h_{V_4}$$

12-3 Compute pipe flow at critical flow:

- Calculate $K_c = \frac{Q_{max}}{D^{5/2}}$
- From the table find the value of K_c Close to calculated K_c and read: $\frac{Y_c}{D}$ and K_p , K_A
- Set $\frac{Y_c}{D} = K_c$ and compute Y_c
- Set $\frac{A_c}{D^2} = K_A$ and compute A_c
- Compute $V_c = \frac{Q_{max}}{A_c}$, $h_{V_c} = \frac{V_c^2}{2g}$
- Calculate maximum specific energy at the critical condition (E_c):

$$E_c = Y_c + h_{V_c}$$

- Calculate the critical slope.
- Set $\frac{Q_n}{D^{8/3} S_c^{1/2}} = K_p$ and calculate S_c for n = 0.013

12-4 Check the pipe slope:

S_c should be $> S_0$

12-5 Compute energy required at section 3:

$$E_3 = E_4 + 0.8(h_{V_c} - h_{V_4})$$

12-6 Check E_3 should be $< E_c$

Otherwise the wasteway channel shall control the pipe flow.

The excess energy = $E_c - E_3$

If the value of $(E_c - E_3)$ is small, an energy dissipator is not required otherwise, an energy dissipator should be considered.

12-7 Compute energy at section 2:

$$E_2 + S_0 L_p = E_c + h_f$$

$$h_f = L_p\left(\frac{S_2 + S_c}{2}\right)$$

by try and error find y_2 in order to satisfies the above equality.

- Assume a value to y_2 which should be greater than y_c .
- Compute the ratio of $\frac{y_c}{D}$ and through the table read K_A and K_p .
- By using the equation $K_p = \frac{Q_n}{D^{8/3} S_2^{1/2}}$ and $\frac{A_2}{D^2} = K_A$ compute S_2 and A_2 .
- Compute $V_2 = \frac{Q_{max}}{A_2}$ and $h_{V_2} = \frac{V_2^2}{2g}$
- Insert the values to the following Bernolli equation:

$$y_2 + h_{V_2} + S_0 L_p = E_c + L_p\left(\frac{S_2 + S_c}{2}\right)$$

If the value of y_2 satisfied the above equation then, calculate:

$E_2 = y_2 + h_{V_2}$ otherwise change the value of y_2 and try it again.

12-8 Compute specific energy at section 1 (E_1) and check the pipe submergence.

- Assume zero velocity in the pool.
- Assume pipe entrance loss, $h_e = 0.5\ h_{V_2}$
- $E_1 = E_2 + h_e$ and $y_1 = E_1$
- $S_m = y_1 - D$

@moorepeyman.ir

REFERENCE DWGS:

Scale:	IRRIGATION & DRAINAGE STANDARDS		ISLAMIC REPUBLIC OF IRAN MINISTRY OF PLAN & BUDJET TECHNICAL RESEARCH AND STANDARD BUREAU
Date:	DWG. No 13/12/4/02	Side channel spillway with slide gate	
Approved:	Sheet No 2 of 3 | Rev No		

DESIGN EXAMPLE

Step 1

Let:

Q_1 = 2.00 m^3/s

y_n = 0.90 m

f_b = 0.60 m

Q_2 = 0.50 m^3/s

El_1= 212.65 m from sea level.

Step 2

2-1 Elevation of spillway crest:
212.65+0.06=212.71

2-2 $H=0.5xf_b-0.06=0.5x0.6-0.06=0.24$ m.

2-3 $L_c=\frac{Q_2}{1.838H^{1.5}}=\frac{0.5}{1.838\times(0.24)^{1.5}}=2.31$ m.

Set L_c = 2.5 m.

Step 3

As $Q_2 = 0.5 < 1.4$ m^3/s

then:

b_2=0.9m. and b_1=0.6 m.

$q_2=\frac{Q_2}{b_2}=\frac{0.5}{0.9}=0.556$

$y_2=0.467q_2^{2/3}=0.467x(0.556)^{2/3}=0.32$ m.

$h_2=1.5y_c+0.3=1.5x0.32+0.3=0.78$ m.

$h_1=h_2-0.05L_c=0.78-0.05x2.5=0.65$ m.

Step 4

4-1 Set $h=y_n=0.9$ m.

$V=0.6\sqrt{2x9.81x0.9}=2.52$ m/s

As $V=2.52 < 3$ m/s then:

$A_g=\frac{Q_1}{V}=\frac{2}{2.52}=0.794$ m^2

4-2 Select gate width=1.00 m and Height=0.80 m. from gate standard presented at check structure structure drawing(Dwg.No.12/1/1/01).

then:

Gate area A_g = 1.00x0.8= 0.8 m^2

Step 5

$El_2=El_1+0.06-h_1-0.05L_c+0.5y_c$

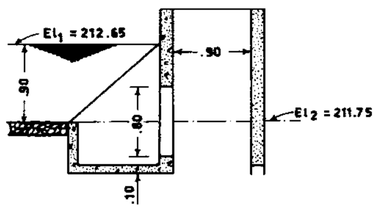
$=212.65+0.06-0.65-0.05x2.5+0.5x0.32$

$=212.10$

Or:

$El_2=El_1-h=212.65-0.9=211.75$

Select El_2=211.75 because 211.75 gives the lower pool water surface.



Step 6

$Q_3=Q_1+Q_2=2.00+0.5=2.5$ m^3/s

let V_p = 3 m/s

Pipe area $A_p=\frac{Q_3}{V_p}=\frac{2.5}{3}=0.833$ m^2

Pipe dia. $D_1=\sqrt{\frac{4A}{\pi}}=\sqrt{\frac{4x0.833}{3.1416}}=1.03$ m.

As far as pipe diameter 1000 mm. gives velocity more than 3 m/s so select pipe diameter D=1200 mm.

D = 1.2 m.

$A_p=\frac{\pi D^2}{4}=\frac{3.1416x(1.2)^2}{4}=1.131$ m^2

$V_p=\frac{Q_3}{A_p}=\frac{2.5}{1.131}=2.21$ m/s

$h_{V_p}=\frac{V_p^2}{2g}=0.25$ m.

6-1 Elevation of pipe crown= $El_2-1.5h_{V_p}$
= 211.75-1.5x0.25=211.38 m.

6-2 Pipe submergence, $S_m=1.5h_p=1.5x0.25=0.38$

6-3 Set S_0= 0.001

Step 7

$H_{ST}=D+S_m+(El_1-El_2)+f_b$

$=1.2+0.38+(212.65-211.75)+0.6$

$=3.08$ m.

Step 8

From type transition table :

E = 1.80 m. L = 2.75 m.

Step 9

Let W = Width of operating road = 4 m.

L_p= W+1.5(H_{ST} - E)+0.3

= 4+1.5(3.08-1.8)+0.3=6.22 m.

Set L_p = 6.5 m.

Step 12

12-1 The following hydraulic data collected for the wasteway channel:

$Q_{max}=Q_3=2.5$ m^3/s

d_4 = 0.85 m.

V_4 = 1.2 m/s

$h_{V_4}=\frac{(V_4)^2}{2g}=\frac{(1.2)^2}{2x9.81}=0.07$ m.

12-2 $E_4=y_4+h_{V_4}=0.85+0.07=0.92$ m.

12-3 $K_c=\frac{Q_{max}}{D^{5/2}}=\frac{2.5}{(1.2)^{5/2}}=1.58485$

From the table and by interpolation:

$\frac{Y_c}{D}=0.72+\frac{1.58485-1.55655}{1.60012-1.55655}x0.01=0.7265$

$K_A=0.60538+\frac{0.61431-0.60538}{0.01}x(0.7265-0.72)=0.61118$

$K_p=0.27054+\frac{0.27520-0.27054}{0.01}x(0.7265-0.72)=0.27357$

$y_c=0.7265\times1.2=0.872$

$A_c=0.61118x(1.2)^2=0.880$

$V_c=\frac{Q_{max}}{A_c}=\frac{2.5}{0.880}=2.84$ m/s

$h_{V_c}=\frac{(V_c)^2}{2g}=\frac{(2.84)^2}{2x9.81}=0.41$ m.

$E_c=Y_c+h_{V_c}=0.88+0.41=1.29$ m.

$K_p=\frac{Q_n}{D^{8/3}S_c^{1/2}}$ Or: $S_c=(\frac{Q_n}{K_pD^{8/3}})^2$

$S_c=(\frac{2.5\times0.013}{0.27357x(1.2)^{8/3}})^2=0.00533$

12-4 $S_c=0.00533 > S_0=0.001$ satisfied.

12-5 $E_3=E_4+0.8(h_{V_c}-h_{V_4})$
$=0.92+0.8(0.41-0.07)=1.19$ m.

12-6 $E_3=1.19 < E_c=1.29$ satisfied.

Excess energy = E_c-E_3 = 1.29 - 1.19 = 0.1 is small so energy dissipator is not required.

12-7 $E_2+S_0L_p=E_c+h_f$

Or:

$E_2-h_f=E_c-S_0L_p=1.29-0.001x6.5=1.28$ m.

Assume y_2 = 0.95

$\frac{y_2}{D}=\frac{0.95}{1.2}=0.79$

From table read K_A=0.6655

K_p=0.30085

$K_p=0.30085=\frac{Q_n}{D^{8/3}S_2^{1/2}}=\frac{2.5\times0.013}{(1.2)^{8/3}x\,S_2^{1/2}}$

$S_2=(\frac{2.5\times0.013}{0.30085x(1.2)^{8/3}})^2=0.00441$

$K_A=0.6655=\frac{A_2}{D^2}=\frac{A_2}{(1.2)^2}$

$A_2=0.9583$ m^2

$V_2=\frac{Q_{max}}{A_2}=\frac{2.5}{0.9583}=2.61$ m/s

$h_{V_2}=\frac{(V_2)^2}{2g}=\frac{(2.61)^2}{2\times9.81}=0.35$

Bernolli equation:

$y_2+h_{V_2}+S_0L_p=E_C+L_p(\frac{S_2+S_c}{2})$

$0.95+0.35+0.001x6.5=1.29+6.5(\frac{0.00441+0.00533}{2})$

1.307 # 1.322

Assume y_2 = 1.00

$\frac{y_2}{D}=\frac{1}{1.2}=0.83$

$K_A=0.69686$ $K_p=0.31513$

$S_2=(\frac{2.5\times0.013}{0.31513x(1.2)^{8/3}})^2=0.00402$

$A_2=0.69686x(1.2)^2=1.0035$

$V_2=\frac{2.5}{1.0035}=2.49$ $h_{V_2}=\frac{(2.49)^2}{2\times9.81}=0.32$

$1.00+.32+.001x65=1.29+6.5(\frac{.00402+.00533}{2})$

1.327 # 1.320

As 1.327 is close to 1.320 then: y_2=1.00

$E_2=y_2+h_{V_2}=1.00+0.32=1.32$

12-8 $E_1=E_2+h_e=E_2+0.5h_{V_2}$

$=1.32+0.5x0.32=1.48$

$y_1=E_1=1.48$

$S_m=y_1-D=1.48-1.20=0.28$

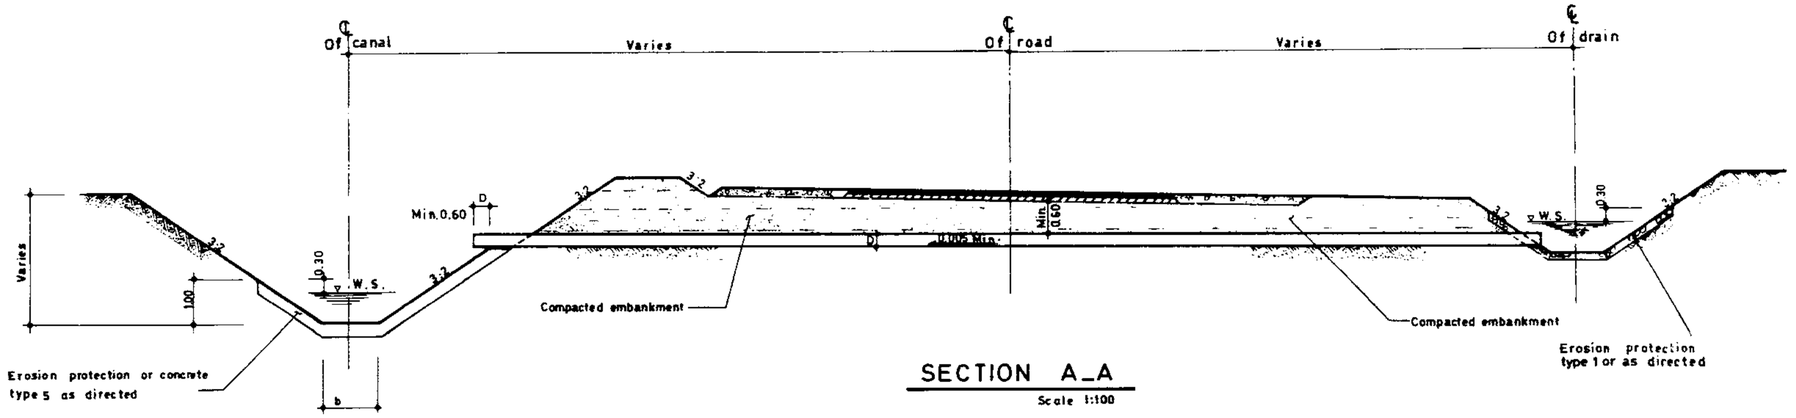
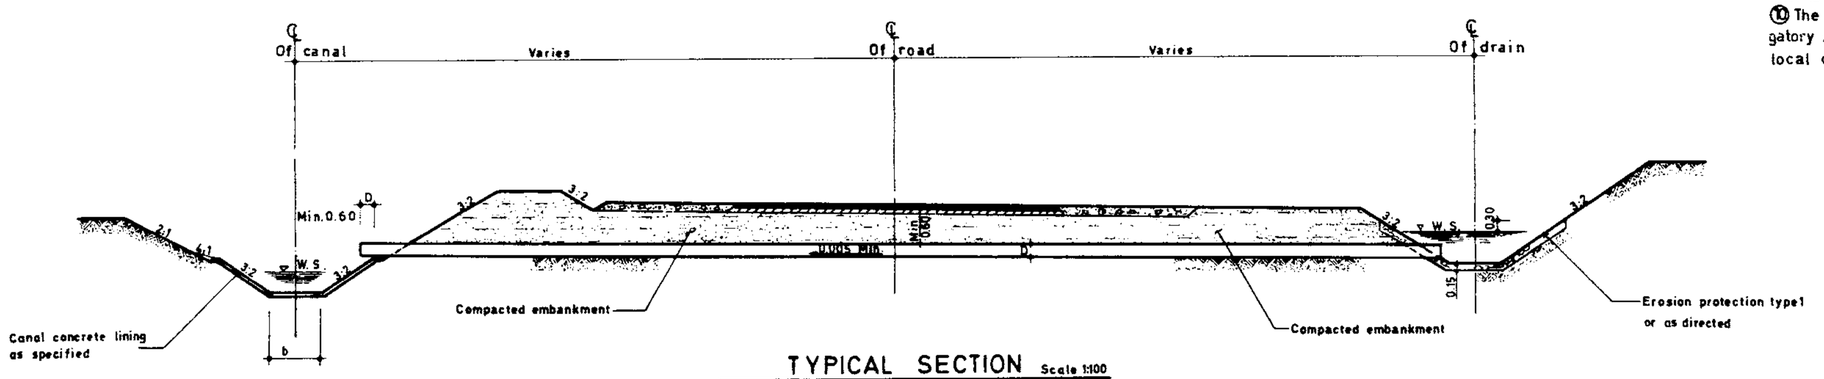
PLAN Scale 1:100
Drain inlet to earth canal



SECTION A_A
Scale 1:100



TYPICAL SECTION Scale 1:100
Drain inlet to concrete lined canal

NOTES:

① Drain inlets are structures used to carry relatively small amounts of storm run-off or drainage water into the canal
② The drain inlet may be located in a natural drainage channel or at the terminal end of an inteceptor drain which parallels the canal. As the inlet end must be above the canal watersurface, the drain inlet is best suited where the canal prism is below the original ground surface.
③ A pipe section is generally used where the design flow is small, and it is therefore the type most commonly used. Use of pipe section is desirable if an operating road crosses the drain inlet.
④ Drain inlets should be designed to accommodate the storm run-off from the drainage area, based upon the design storm frequency (usually 25 years).
⑤ Where overflow wasteway facilities are not provided for a reach of canal, the total design capacity of all drain inlets within that reach should be limited to 10% of the normal design capacity of the canal.
⑥ Where an overflow wasteway facility is provided, the design capacity of an individual drain inlet should not exceed 10% of the cumulative in flows from all drain inlets within that reach should not exceed 20% of the normal design capacity of the canal.
⑦ Earth inlet transitions are usually satisfactory for drain inlets. If a particular situation requires a concrete transition its type should be determined on the basin of the cendi-tions discussed in dwgs.№13/7/1/01 or 13/9/1/01_13/11/1/01
⑧ To prevent degradation of the inlet channel and to provide complete drainage of the channel the pipe invert (assuming an earth transition) should be set at or slightly below the original ground surface of the channel invert. The invert must be preferably 15cm. but at least 10cm. above the normal water surface in an earth canal or 3cm. above the maximum water surface.
⑨ The pipe diameter should be determined on the basis of a maximum full pipe velocity of 3 m./s. if a concrete inlet is used and 1.5 m./s. if an earth transition is used.
⑩ The road dimensions shown on this dwg. are not obligatory and could be changed or revised with respect to local or project conditions.

NOTES

(1) Dimensions in the table are for the pipe diameters sized for a full pipe flow velocity of 3.5 m/s with a free flow pipe inlet.
(2) The dimension provide control at inlet headwalls for design capacity and free flow pipe.
(3) To prevent degradation at the inlet the top of the inlet wall is placed at or near existing ground surface.
(4) A maximum full pipe flow velocity of 3.5 m/s is permitted for cross drainage culvert structures having baffled outlets or stlling pools.

REFERENCE DWGS: For general notes see dwgs № 20/2/1/01 to 20/2/1/03
For reinforcement see dwg. № 13/9/3/01
For detail of pipe connection to structure see dwgs. №17/1/1/01 to 17/1/1/03

NOTES

① Dimension provided in the table are for different capacities, to be fitted to the working condition.
② Full-pipe velocities range from about 1.5 m/s for 600 mm dimension pipe to about 3 m for all pipe diameters listed. The dimensions provided control at the inlet headwall and also at freeboard at the headwall for the design capacity and free-flow pipe.
③ A maximum full-pipe flow velocity of 3 m/s is permitted for cross drainage culverts.
④ To prevent degradation at the inlet the top of the inlet wall is placed at or near existing ground surface.
⑤ Structures numbered 600_4, 700_2, 800_2, 900_2, 900_3 and 1000_2 may also be used for velocities up to 3.5 m/s.

REFERENCE DWGS. For general notes see dwgs. Nº 20/2/1/01 to 20/2/1/03
For reinforcement see dwg. Nº 13/8/3/01
For detail of pipe connection to structure see dwgs. Nº 17/1/1/01 to 17/1/1/03

NOTES:

① Dimensions in the table are for pipe diameters sized for a full pipe flow velocity of 3 m/s , and a free-flow pipe with hydralic control at the inlet transition headwall.

② To prevent degradation at the inlet the invert at the transition cutoff is located at or near existing ground surface.

③ The tabulateu dimensions provide for freeboard at the inlet headwall. If submergence of the top of the headwall for design flow is not objectionable, the listed transition dimensions may also be used for design flow for a full pipe velocity of 3.5 m/s. In this case a baffled outlet is required.

④ A maximum full-pipe flow velocity of 3 m/s is permitted for cross-drainage culvert structures having concrete outlet transitions.

REFERENCE DWGS: For general notes see dwg. Nº. 20/2/1/03
For reinforcement see dwg. Nº. 13/7/3/01
For detail of pipe connection to structure see dwgs. Nº. 17/1/1/01 to 17/1/1/03

DIMENSION INFORMATION

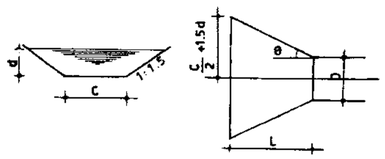
Let :

D = Pipe diameter
L = Transition length
C = Base width at cutoff wall
d = Depth of water
θ = Water surface angle

The following relationship between the dimension should be considered :

- L = 3D
- Dimension B is chosen so that the 1.5 to 1 sloping walls are approximately tangent to the opening at the headwall for simplification let.

  B = 3/3 D
- C dimension is dependent to the water surface angle.



From the above fig :

C = 2L tgθ - 3d + D

or

C = (6 tg θ + 1)D - 3d

- Dimension C could be calculated easily by using the following table.

D/d ratio	θ = 22.5°	θ = 25°	θ = 27.5°
1	C = 0.5 D	C = 0.8 D	C = 1.1 D
1.25	C = 1.1 D	C = 1.4 D	C = 1.7 D
1.50	C = 1.5 D	C = 1.8 D	C = 2.1 D
2	C = 2 D	C = 2.3 D	C = 2.6 D

- Freeboard at the transition cutoff adjacent to concrete canal lining or other hard surface or burried membrance canal lining shall be selected according to the following table.

Water Depth at Cutoff (m)	Minimum Freebord (cm)
d ≤ 0.35	15
0.35 < d ≤ 0.60	23
0.60 < d ≤ 1.50	30

- The invert at the headwall opening is established by the required submergence of the top of the opening as discussed under design consideration.
- P value is difference in elevation of the invert at the transition cutoff and at the headwall opening.

$$P \leq \frac{3}{4} D \text{ for inlet}$$

$$P \leq \frac{1}{2} D \text{ for outlet}$$

- Y = Water depth at cutoff(d) + freeboard at cutoff
- $a = \frac{D}{\cos\alpha} + 1.5\left(\frac{V_1^2}{2g} - \frac{V_2^2}{2g}\right)$ + freeboard at cutoff ≥ Y + P

For D ≤ 600 mm a may be taken equal to Y + P

For D > 600 mm a shall be taken greater than Y + P

Dimension e and tw may be determind according the following table.

Depth of water in canal (d) (m)	e (m)	tw (m)
d ≤ 90	0.60	0.15
90 < d ≤ 1.80	0.75	0.20
1.80 < d	0.90	0.20

Structure Description

Transitions are used at structure inlets and outlets or at the change in canal sections for the following purposes:

- Reduce energy loss
- Provide smoother water flow
- Minimize canal erosion
- Provide additional stability to adjacent structures because of the added resistance to percolation
- To retain earth fill at the ends of structures
- Reduce ponded water surface elevations at cross-drainage structures

Classification & Application

Six types of transitions are presented in this publication:

Type 1. or Broken back could be used for in-line canal structures. This type of transition is also used for cross-drainage structures if the natural drainage canal has well-defined cross section with dimensions that reasonably be transitioned to the broken-back cross section.

Type 2. Could be used for cross-drainage structures, where the channel is wide and poorly defined.

Type 3. Could also be used for cross-drainage structures, where the channel is poorly defined, by extending the pool beyond the end of sloping sidewalls, a longer crest result. By lowering the invert, the headwall opening is lowered, resulting lower water surface elevation for the inlet pool.

Type 4. Except for its sloping floor and omission of headwall cutoff, this type of transition is similar to type 3. The sloping floor permits a lower pipe invert at the inlet headwall if type 4 transition is used.

Type 5. This type of transition is sometimes used to transition from a contretelined canal to a pipe structure.

Design Considerations for Pipe Structure Transition

1. Pipe Submergence

1-1. Head losses

Let:

V_c = Flow velocity in canal (m/s)

V_p = Flow velocity at the centerline section of the closed conduit at the headwall (m/s)

Energy losses in transitions could be calculated as follows:

Energy losses at inlet = $K_1(\frac{V_p^2}{2g} - \frac{V_c^2}{2g})$

Energy losses at outlet = $K_2(\frac{V_p^2}{2g} - \frac{V_c^2}{2g})$

For broken-back transition K_1=0.4 and K_2=0.7.

1-2. Friction Losses

Friction losses for short transitions associated with capacities up to 3 m^3/s will be small and are usually omitted.

1-3. Pipe Sumbergence

Inlet transition to pipe structures where the hydraulic control is at the downstream end of the structure should have a seal of $1.5(\frac{V_p^2}{2g} - \frac{V_c^2}{2g})$ but not less than 8 cm.

The seal is measured between the upstream water surface of the inlet transition and the top of the opening in the transition headwall, where an inlet transition connected to a free-flow closed conduit in such a way that the conduit inlet is sealed, the head required to discharge the design flow can be determine by orifice equation.

$$Q = CA\sqrt{2gh}$$

Where:

Q = Discharge (m^3/s)

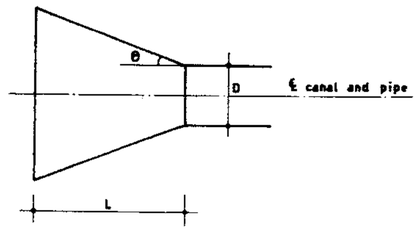
A = Pipe area (m^2)

h = Head (m) measured from the center of the headwall opening to the inlet water surface.

C = Discharge Coefficient = 0.6

2. Water Surface Angle

Water surface angle is defined; the angle between water surface and transition centerline(θ).



Water surface angle should not exceed $27\frac{1}{2}$ for inlet transition and $22\frac{1}{2}^\circ$ for outlet transition. For some designs it may be more economical to use angle of 25° for either inlet and outlet transition.

3. Channel Erosion

The following criteria should be used to prevent undue channel erosion downstream from a structure outlet:

Pipe Velocity V_p (m/s)	Erosion Protection
$V_p \leq 1$	An earth outlet transition is sufficient
$1 < V_p \leq 3$	An concrete outlet transition should be used
$3 < V_p$	A baffled outlet or stilling pool should be used.

General Notes for Transition Type 2,3 and 4

1. To provide adequate free board for the canal, the inlet water surface for design flow should be at least 0.6 meter below the top of the canal bank.

2. The equation $Q = CA\sqrt{2gh}$ may be used to calculate the inlet water surface required to discharge to design flow.

   h measured from the opening centerline to the water surface and C = 0.6 .

   For free flow the following equation could be used for determining the required head:

   $$h = 0.14206\, V^2$$

   Where V is the design velocity of the pipe in m/s and h is the required head in meter.

NOTES:

1 _ The types of erosion protection shown on various drawings represent minimum thickness and sizes of material to be used, and adjustment should be made to the local conditions.

2 _ 15 Cm. sand and gravel bedding (filter material) for rip rap should be a continuous layer of sand and gravel or sand and crushed rock, reasonably well graded to a max. of 35mm. in size

3 _ Stone protection and filter material shall be placed in a uniform thickness normal to finished grade and to the limits shown on plans and sections.

4 _ Type of stone protection to be used for inlets and outlets of various irrigation and drainage structures shall be selected from the table "type of protection"

5 _ Unless otherwise noted transition length from the end of the conduite to existing channel shall be 3 times. D for inlet and 4 times. D for outlet or determined by the engineer

6 _ Metal guard railing shall be determined by the engineer if required.

7 _ Bottom width at the end of stone protection to be 2.5xH or 2.5xD for drainage culvert and HorD for irrigation culvert or the outside width of the inlet and outlet structures whichever is greater.

8 _ H calls for box and D calls for pipe

NOTES :

1- Turnouts are used to divert water from a supplly channel to a smaller channel. Pipes are generally used to carry the water through the bank of the supplly channel.

2- The conduit and outlet sections of the structure may be designed as part of another type of structure such as a siphon or a drop or they may connect to water measurement structure.

3- Design considerations: a) For velocity in the pipe and other hydraulic considerations see notes on dwg. № 11/6/1/02. b) Turnout inlet should be set so that they do not protrude into the canal prism. the slope of the sidewalls should be such that they will not interfere with cleaning and maintaining the canal.

c) The airvent shown on this dwg. is to prevent the formation of a vacuum downstream of the turnout gate and may be omitted when the turnout is submerged by the design delivery water surface.

REFERENCE DWGS: For reinforcement see dwg. № 12/8/3/01

For general notes see dwgs. № 20/2/1/01 TO 20/2/1/03

NOTES:

1. Division structures are used to divide the flow from a supply pipe or channel into two or more channels or pipes.
2. Division structures may be an operating structure or it may be the outlet of a siphon, a drop, or a turnout from which further diversion is required.
3. Adjustable gates used to provide a means of control and measurement of flow.
4. Various combinations of supply and delivery are shown on dwgs. №12/7/1/01 to 12/7/1/09. In practice any of the possible combinations may be encountered.
5. Design considerations:
   (a) water must be delivered to the division structure at an elevation that will provide enough head on the gates to furnish the required flow at the required delivery water surface elevation.
   (b) when delivery to the division structure is through a pipe, the velocity in the pipe is kept to about 0.45 m s. to reduce turbulence ahead of the weir.

STRUCTURE PURPOSE

The purpose of a check and pipe inlet is to maintain a water surface at a required elevation for turnout deliveries upstream with partial flows in the canal.

PIPE SELECTION

The criteria for determining a pipe size for a structure having a check and pipe inlet is based on providing a pipe with an adequate diameter so that the velocity in the pipe will not exceed the following:

1_ 1.0 m per second for a pipe drop having only an earth transition at the outlet.
2_ 1.5 m per second for a road crossing or a similar structure such as a short inverted siphon having a concrete outlet transition.
3_ 3.0 m per second for a relatively long inverted siphon having a concrete outlet transition.
4_ 3.5 m per second for a pipe drop having a baffled outlet or stilling pool outlet.

DESIGN PROCEDURE :

1_ Determine pipe size from Dwg. N° 11/6/1/02
2_ Select structure number from the Dimension Table Dwg N° 12/6/1/02
3_ Determine :
   a) Standard check and pipe inlet dimension K R Y_1 and L from the Dimension Table.
   b) Pipe velocity head for selected pipe diameter from equation $h_{vp} = \frac{V_p^2}{2g}$
   c) Determine elevation D :
      El. D = NWS El. at Sta. A-R
      NWS El. at Sta. A = El. A + Y
      Y is normal depth at Sta A
   d) Drop and slope in transition :
      Drop = R - (Y+Y_1)
      Slope = Length of transition to drop that in earth transition must be flatter than 4 to 1.
4_ Select gate size
   e) Determine normal canal free board that is equal to El. canal bank_El NWS in canal.
   f) For extrem condition, when the gate is closed, canal bank free board must be adequate for the normal flow over flowing from the sidewalls and gate closure.
   g) Check when gate is closed being at a higher elevation than the sidewalls.

REFERENCE DWGS: For general notes see dwgs. N°. 20/2/1/01 TO 20/2/1/03
For reinforcement see dwg. N°. 12/6/3/01

NOTES

Structures are numbered to designate pipe diameter in milimeters followed by a second number -1 or -2 which designate maximum allowable pipe velocities of 1.5 and 3.5 meter per second respectively.

Structures -1 and -2 may also be used for maximum allowable pipe velocities of 1.00 and 3.00 meter per second respectively:

Structure number 600_2 is for a 600 mm diameter pipe having a maximum allowable velocity of either 3.0 or 3.5 meter per second.

PROCESS TO SELECT CONTROL NOTCH

A control notch must control discharge from 0.2 Q to Q_{Max} . For selecting a proper notch & its dimension proceed with the follow-ing steps .

LET:

b = Bottom width of the canal , (m).

m = Side slope of canal .

Y = Depth of flow, (m).

A = Area of flow cross section = $bY+mY^2$

↑ = Wetted perimeter = $b+2Y\sqrt{m^2+1}$, (m) .

R = Hydraulic radius = $\frac{A}{P}$, (m) .

S = Canal bottom slope .

n = Manning's roughness coefficient .

Q = Discharge = $\frac{1}{n}AR^{2/3}S^{1/2}$, (m^3/s) .

V = Velocity = $\frac{Q}{A}$, (m/s) .

h_v = Velocity head = $\frac{V^2}{2g}$, (m) .

E = Energy head = Y+h , (m) .

P = Bottom width of control notch , (m) .

W = Control notch side slope .

T = Height of the notch , (m) .

STEP 1

For a given b, m, n, S & Q set up, calculate & fill the following table.

	Y(m)	$A(m^2)$	V(m/s)	h_v(m)	E(m)
Q Max =	.....	.....	.....	.....	.....
$0.2Q_{Max}$ =	.....	.....	.....	.....	.....

NOTE : To expedite the above calculation, use "tables of hydraulic properties of trapezodial canals".

STEP 2

From the 6 graphs presented for control notch, select the graph having the smallest P value which furnishes the full range of discharge. Enter the graph with Q_{Max} & its corresponding E . Read the value of "W" on the first curve which lies immediately to the right of the point , check in the same manner for $0.2Q_{Max}$ & its corresponding E. IF the curve has been the same for bpth discharge, read P & W values and go to step 3, otherwise try the graph with the next greater P value, and repeat the same procedure until one of the slope curve lies on the right of the two points .

STEP 3

SET:

T ⩾ Y WHEN Q IS MAX

THEN:

N = P+2WT

DESIGN EXAMPLE

GIVEN:

Q = 1.4 m^3/s

S_1 = 0.0005

m = 1.5:1

n = 0.025

b = 1.5 m

y_1 = 0.86 m

required:

bottom width of control notch : P

control notch side slope : W

height of notch : T

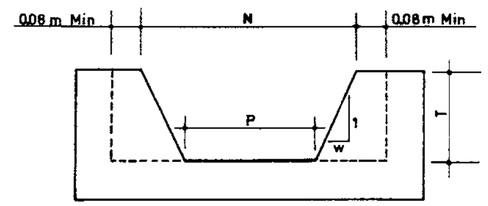
SOLUTION:

STEP (1)

$A_1 = 1.5\times0.86+1.5\times(0.86)^2 = 2.399\,m^2$

$V_1 = \frac{Q}{A} = 0.584$ m/s FOR Q MAX

$h_{v_1} = \frac{V^2}{2g} = \frac{0.584^2}{2\times9.81} = 0.02$ m



$E_1 = y_1+h_{v_1} = 0.86+0.02 = 0.88$ m

$0.2\times Q_{Max} = 0.280\ m^3/s$

$y_2 = 0.368$ m

$A_2 = 0.755\ m^2$

$v_2 = \frac{0.28}{A_2} = 0.371$ m/s

$h_{v_2} = 0.007$ m

$E_2 = y_2+h_{v_2} = 0.375$ m

	Y(m)	$A(m^2)$	V(m/s)	h_v(m)	E(m)
Q_{Max}=1.4	0.86	2.399	0.584	0.02	0.88
0.2Q=0.28	0.368	0.755	0.371	0.007	0.375

STEP (2)

From graphs on dwg :

a) For P = 0.40 :

a-1) For Q_{Max} : W = 0.50

a-2) For 0.2Q : W = 0.75

"The two choosen W are not the same".

b) For P = 0.50 :

b-1) For Q_{Max} : W = 0.50

b-2) For 0.2Q : W = 0.50

This control notch is satisfactory as it will act as a control for all - discharges between 1.4 m^3/s and 0.28 m^3/s

STEP (3)

T = 0.86

THEN :

N = 0.50+2x0.50x0.86 = 1.36

SECTION C_C

NOTES:

1- To determine values for P,T & N proceed with step by step design procedure given in dwg. No 12/5/2/01. and dwg No 12/5/2/02

Side slope of notch is shown on dwg. No. 12/5/2/01

2_For pipe diameter selection see dwg No. 11/6/1/01 or dwgs. 11/3/1/01 to 11/3/2/18 or dwgs.11/2/1/01 to 11/2/2/09

3_For determining inlet Box width

set $b_1 = N + 0.30$

and $b_1 = D + 0.60$

and chose the greater value.

DETAIL_A

NOTES:

1. N = № of guard posts.
2. For Q greater than 1 m^3/s, upstream handrails required with a safety chain at gate opening.
3. All checks shall have continuous handrail bolted to precast conc. bolt.
4. Gate frame height measured from ℄ of gate opening.
5. For construction detail of gate frame guide see dwg. № 12/6/1/01
6. Chamfer all exposed corner 2 cm. unless otherwise shown.
7. Values of L_2 given in table are the minimum required lengths.

CHECK DROPS SELECTING PROCEDURE:

1. Determine "Q" in m^3/s in U/S canal.
2. Select the structure from "dimension table" with respect to required "Q".
3. If the required "Q" not found in the table, select the structure's dimensions with the next largest "Q".
4. El. D is equal to: El. A + y_1
5. El. B = El. D-(C+0.45)
6. El. C = El. A - required change in grade
7. Check if El. B ≤ El. C
8. If El. B is higher than El. C, a structure with a larger dimension C should be selected.

REFERENCE DWGS: For general notes and minimum requirements for detailing reinforcement see dwgs. 20/2/1/01 TO 20/2/1/03
For reinforcement see dwg. №: 12/3/3/01
For construction detail of gate frame guide see dwg. №: 12/6/1/01

NOTES:

① N = Nº of handrail
② For "Q" greater than 1 m^3/sec. upstream handrail is required with a safety chain at gate opening.
③ All checks shall have continious handrail bolted to precast concrete deck.
④ Gate frame height measured from ℄ of gate opening.
⑤ Chamfer all exposed corner 2 cm unless other wise shown.
⑥ Values of L_2 given in table are the minimum required lengths.

CHECK STRUCTURE SELECTING PROCEDURE:

① Determine "Q" in m^3/s in U/S canal.
② Select the structure from "dimension table" with respect to required "Q".
③ If the required "Q" not found in the table, select the structure's dimensions with next largest "Q".
④ El. D is equal to: El. A + y_1
⑤ El. B = El. D - "C"
Note that El. B should be equal to or less than El. "A" to avoid a jump in the bottom of the canal. If El. B is higher than El. A, a structure with a larger dimension should be selected.
⑥ D/S water elevation "El. E" is equal to: El. D - 0.5 h_v in which, h_v is the difference between the velocity head at the check opening and the velocity head in canal section upstream of the structure. A minimum head los of 0.03m. should be allowed
⑦ El. C: El. E - y_2

REFERENCE DWGS: For general notes and minimum requirements for detailing reinforcement see dwgs. 20/2/1/01 TO 20/2/1/03
For reinforcement see dwg. Nº 12/1/3/01
For construction detail of "gate frame guide" see dwg. Nº 12/6/1/01

NOTES

DESIGN CONSIDERATIONS

1) Inverted siphons are used to convey canal water by gravity under roads, railroads, other structures, various type of drainage channels and depressions.

2) The pipe cover requirements are :

   a) Min. 0.60 m. of earth cover for all siphons crossing under roads and railroads. Back fill should be thoroughly compacted.

   b) Min. 0.90 m. of earth cover for siphons crossing under cross-drainage channels unless studies indicate more cover is required because of projected future retrogressions of the channel.

   c) Min. 0.60 m. of earth cover for siphons crossing under an earth canal.

   d) Min. 0.15 m. of earth cover between the concerete canal lining and the top of pipe, is required.

3) The following siphons require either a concrete inlet transition or some type of concrete outlet transitions:

   a) All siphons crossing under railroads and state highways.

   b) All 0.90 m. diameter and larger pipe siphon crossing roads.

   c) All siphons in unlined canals with water velocities in excess of 1.0 m/s.

   d) If there is a need for controlling the water surface elevation upstream from the siphon a check and pipe inlet or a control and pipe inlet is to be used

4) In general, siphon velocities should range from 1.0 to 3.0 m/s depending on available head. The following velocity criteria may be used in determining the diameter of siphon :

   a) 1.0 m/s or less for a relatively short siphon with only earth transitions provided at inlet and outlet.

   b) 1.5 m/s or less for a relatively short siphon with either a concrete transition or a control structure provided at the inlet and a concrete transition provided at the outlet.

   c) 3.0 m/s or less for a relatively long siphon with either a concrete transition or a control structure provided at the inlet and a concrete transition provided at the outlet.

5) EL.B.is equal to EL.A-head losses. Head losses which should be considered are as follows:

   a) Convergence loss in the inlet transition.

   b) Check structure losses when a check is installed in the inlet.

   c) Control structure losses when a control is installed in the inlet.

   d) Friction and bend losses in the pipe.

   e) Diversion loss in the outlet transition.

   f) Transition friction losses are usually ignored for the size of structures in this publication.

   g) Convergence and divergence head losses in earth transitions when required between the canal and concrete transition are usually small and ignored.

   h) The total computed head loss is usually increased by 10% as a safety factor.

6) a) The hydraulic head loss in transition is dependent on the difference of the velocity heads in the canal and the normal to centerline section of the closed conduit.

   b) Coefficients of velocity head considered adequate for determining head losses in a broken-back type of transition (Concrete transition type 5, dwg. No. 13/11/1/01) shown in this dwg., are 0.4 for the inlet and 0.7 for the outlet.

   c) Coefficients of velocity head considered adequate for determining head losses in earth transitions from the canal to a pipe are 0.5 for the inlet and 1.0 for the outlet.

   d) For min. hydraulic loss, it is desirable to provide a seal of 1.5 h_v, with 0.08 m. minimum at pipe inlet and no submergence at the pipe outlet. The seal is equal in height to vertical drop from the normal canal water surface to the top of the siphon opening. ("S" on section A-A).

   e) If the siphon has both upstream and downstream concrete transitions, it may be economically desirable to construct the D/S transition the same as the upstream transition.

   f) Pipe friction losses are determined by using Manning formula.

   g) Pipe bend losses are determined by using Fig-1.

7) Design procedure :

   a) Determine inlet and outlet structures and approximate size of pipe.

   b) Make a preliminary layout of the siphon and determine L_1, L_2, L_3, α_1 and α_2 cover and submergence requirements.

   c) Compute the siphon head-losses in this layout.

   c-1) If the computed losses are greater than the difference in U/S and D/S canal water surface, the pipe size should be increased or the canal profile revised to provide adequate head.

   c-2) If the computed losses are appreciably less than the difference in U/S canal water surface, it may be possible to decrease the size of pipe, or the canal profile may be revised.

8) When the pipe profile permits vaccum an air vent should be provided, as shown on dwgs. 12/8/1/01 or 12/9/1/01.

NOTES

1. Road crossing conduit may have a straight line profile as shown in this dwg. or a profile with vertical bends which function either as inverted siphons, drops or chutes.
2. Road crossing with straight line profile is designed for flow with little or no internal hydrostatic pressure.
3. For pipe selection see dwg. Nº. 11/6/1/01 and considered:
   a) A maximum allowable velocity of 1.0m/sec for a pipe with earth transitions.
   b) A maximum allowable velocity of 1.5m/sec for a pipe with concrete transitions or other concrete inlet and outlet structures.
4. If there is a need for controlling the water surface elevation upstream from the road crossing, a check inlet or a control inlet is used. If one of these structures is required, it is usually economically desirable to also use a concrete outlet structure and size the pipe based on a maximum velocity of 1.5 m/sec.

NOTES:

1_The excess energy dissipation must be accomplished at the outlet with either a baffled outlet or sttiling pool.
2_Pipe drop with baffled outlet will be used when there is not enough space to dissipate energy in sumped pipe.
3_The type II pipe drop should have a check inlet or a control inlet if the drop in an inline canal structure and have a reinforced concrete inlet transition (type 1,2,3 or 4) if is a cross-drainage structure.
4_The maximum full pipe velocity is 3/5 m/sec.
5_L_1 and L_2 must be calculated on field conditions.

STRUCTURE'S DESCRIPTION

Pipe drop conveys water from a higher elevation to a lower elevation through a piping system.

STRUCTURE COMPONENTS

Pipe drop consists of: Upstream Transition, Inlet Structure, Pipe and Outlet Transition.

APPLICATION

a. Pipe drop could be used where the drop in elevation is with in the range of 0.90 to 4.6 meters
b. The inlet may serve as a control device to regulate the water depth at the utream of the canal.
c. The inlet and outlet can be adapted to either earth or a lined water way.
d. The outlet can be adapted to a water way where there is no downstream water surface control.
e. The inlet can be incorporated either with a control notch or with a check.
f. Pipe drop can be used under another water-way or a road way.

CLASSIFICATION

In general, two types of pipe drops are introduced:

Type I - Which is used as an inline canal structure where the possibility of clogging is minimal.
This type of pipe drop is used either with earth or concrete outlet transition.
See Dwgs.No.11/2/1/01 and 11/3/1/01.

Type II - Which is used as an inline canal structure or as a cross-drainage structure.
This type of pipe drop is used either with a baffled outlet or a stilling pool.
See Dwg.No. 11/4/1/01.

How to fit a pipe drop with the design condition

For fitting a pipe drop to the design condition proceed with the following steps:

1. Decide which type of pipe drops well suit the desired condition.

   Recommendation

   There are three ways by which a pipe drop can be selected:

   Use the drop selection model Dwg.No. 11/0/4/01 or

   Use Designer's own judgement and/or

   Use the following general rule:

   - If the possibility of clogging is minimal, canal is lined and $Q \leq 1.5$ m^3/s select pipe drop type I with concrete outlet transition.
   - If the possibility of clogging is in minimal but canal is not lined and $Q \leq 0.70$ m^3/s select pipe drop type I with earth outlet transition.
   - If $Q > 1.5$ m^3/s or the structure is used as cross-drainage or sediment and debris are carried in the water, use type II pipe drop with the following considerations:
     - Use type II with stilling pool where water carries weeds.
     - Use type II with baffled outlet in other cases.

2. Read elevations of A and H from the profile sheets.

   let:

   El.A = Elevation of point A.
   El.H = Elevation of point H.
   El.A_W = Elevation of normal water surface at point A.
   El.H_W = Elevation of normal water surface at point H.
   El.A_E = Elevation of energy gradient at point A.
   El.H_E = Elevation of energy gradient at point H.
   H = El.A_E - El.H_E

3. Select type of inlet structure.

   Recommendation

   - If the upstream water level is being maintained and flow varies very often, use control notch.
   - If the upstream water level is being maintained and flow does not vary often, use check.

4. If the selection is made on type II, follow the step 9 below. Otherwise proceed with the following steps.

5. From the table named " Pipe Selection Table " Dwg.No.11/2/2/01 select pipe diameter(D).

6. From the tables named " Pipe Drop with Concrete Outlet Transition " or " Pipe Drop with Earth Outlet Transition " Dwg.No. 11/2/2/01 select the proper table which best fits to the canal flow(Q) and selected D.
   These tables are designated by PDE and PDC, where PDE is referred to pipe drop with earth outlet transition and PDC to pipe drop with concrete outlet transition.

7. Find relevant table and read R at the top of the table.
   Match the calculated H to the values of H given in the first row of the table and select the column with nearest value of H to the calculated one.
   From the selected column read the following construction dimensions:

   L, L_1, L_2, L_3, H_1, S and θ.

   S, value designate the expected submergncy but this figure should be recalculated.

8. Calculate the rest of elevations and submergences(S).

   El.D = El.A_W - R - H_1
   El.E = El.D - 0.005 L_2
   El.F = El.E + L_3 sin θ
   El.F' = El.F + D cos θ If earth outlet.
   El.F' = El.F + D cos θ + D sin$^2\theta$/cos θ If concrete outlet.
   S = El.H_W - El.F'

   GOTO Step 11.

9. See Dwg.No. 11/2/2/01 for pipe selection and receiving the basic design considerations for adaption the pipe drop to the existing condition.
10. If the outlet is baffled, refer to Dwg.No. 11/4/1/01 . If it is stilling pool refer to Dwg.No. 14/10/1/01.
11. To obtain the structural data for inlet structure proceed as follows:

    If control notch is selected, refer to Dwg. No.12/5/1/01.

    If check is selected, refer to Dwgs.No. 12/1/1/01 & 12/1/1/02.

    If you are adapting type II pipe drop, it is possible to use a transition as an inlet. In this case the structure does not regulate the upstream water surface

    In case of selecting was the transition as an inlet, the transition type 1,2,3 and 4 may be used. See Dwgs.No.13/7/1/01, 13/8/1/01, 13/9/1/01 and 13/10/1/01 Respectively.

EXAMPLE

Select a drop which has also to be used for controling the upstream water level for a flow ranging from 500 to 900 lit/s.

The hydraulic properties of upstream and downstream of the canal are as follows:

Q = 900 lit/s	m = 1.5:1
B = 0.80 m.	n = 0.014
Y = 0.55	S = 0.0009
V = 1.00 m/s	

2) El.A = 110.00
El.H = 108.09
El.A_W = El.A + Y = 110.00 + 0.55 = 110.55
El.H_W = El.H + Y = 108.09 + 0.55 = 108.64
El.A_E = El.A_W + $V^2/2g$ = 110.55 + $(1.00)^2/2g$ = 110.60
El.H_E = El.H_W + $V^2/2g$ = 108.64 + $(1.00)^2/2g$ = 108.69
H = El.A_E - El.H_E = 110.60 - 108.69 = 1.91 m.

3) Control notch is selected as inlet structure.

5) From the pipe selection table:
D = 900 mm.

6) By entering Q = 0.90 m^3/s and D = 900 mm. into the " Pipe Drop with Concrete Outlet Transition Table " Dwg.No.11/2/2/01. Read table No. PDC 53. This table is shown on Dwg.No.11/3/2/14.

7) From table PDC 53 :
R = 1.30 m.
Column which its H = 1.93 fits the calculated H value. Then:
L = 6.00 m. L_1 = 5.54 m.
L_2 = 4.50 m. L_3 = 1.50 m.
H_1 = 2.30 m. θ = 22.5
S = 0.17 m.

8) El.D = El.A_W - R - H_1
= 110.55 - 1.30 - 2.30 = 106.95
El.E = El.D - 0.005 L_2
= 106.95 - 0.005 x 4.50 = 106.93
El.F = El.E + L_3 sin 22.5
= 106.93 + 1.50 x 0.38268 = 107.50
El.F' = El.F + D cos 22.5 + D sin$^2\theta$ /cos θ
= 107.50 + 0.9x0.9239 + 0.9x0.14644/0.9239 = 108.47
S = El.H_W - El.F' = 108.64 - 108.47 = 0.17 m.

11) For calculating the dimensions of control notch follow the procedure given at Dwg.No.12/5/2/01.

The inlet structure should control upstream water surface for the range of Q = 500 to 900 lit/s.

for Q = 0.90 m^3/s :
Y = 0.55 m.
V = 1.00 m/s
E = 0.55 + $\frac{(1.00)^2}{2g}$ = 0.60 m.

for Q = 0.500 m^3/s :
Y = 0.41 m.
V = 0.86 m/s
E = 0.41 + $\frac{(0.86)^2}{2g}$ = 0.45 m.

The first graphs satisfies the condition, so :

P = 0.40 m. & W = 1.25
T ≥ Y for Q = 0.90 T = 0.55
N = P + 2WT = 0.40 + 2 x 1.25 x 0.55 = 1.375 ≃ 1.38

Determine the inlet box inside (b_1):

b_1 = N + 0.30 = 1.38 + 0.30 = 1.68 m.

and

b_1 = D + 0.60 = 0.90 + 0.60 = 1.50 m.

which b_1 = 1.68 m. is selected.

Determine the elevation top of the notch:

El.top of the notch = El.A + T
= 110 + 0.55 = 110.55

The rest of the dimensions of inlet structure can be extracted from the table given on Dwg.No.12/5/1/01 selecting structure No. 900-1, where 900 refers to pipe diameter and 1 refers to structure which its R value is equal to the R value of the pipe drop.

Notes for pipe selection table:

1 – The max. capacity of standard pipe drops presented in this section are as follows.
- Pipe drop with earth outlet transition 700 lit/s
- Pipe drop with concrete outlet transition 1500 lit/s

2 – The pipe selection table is designed in the manner that the full pipe velocity of water not exceeding 1.00 m/s for pipe drop with earth transition and 1.50 m/s for pipe drop with concrete transiton.

3 – Mark ▨ indicates pipe drop with concrete outlet and ■ indicates pipe drop with earth outlet.

Notes for pipe drop with concrete and earth transition tables:

1 – The min. & max. of (H) shown on these tables indicates the range of the drop provided on the corresponding tables but in practice it is advisable that the range be bounded between 0.90 to 4.60 meters.

2 – Table Nos such PDC 08 or PDE 13 are considered as structure Nos.

| | | |

TABLE # P DE. 29 (Q =0.625 M^3/S , D= 1000 mm , R=1.40 m)

| | | |

STRUCTURE'S DESCRIPTION

Rectangular Inclined Drop (R.I.Drop) in a rectangular shaped structure with constant width that conveys water from a higher elevation to a lower elevation.

STRUCTURE COMPONENTS

Rectangular Inclined Drop consists of the following hydraulic elements:

- Inlet
- Inclined Channel
- Stilling Pool
- Outlet, and
- Downstream Transition

APPLICATION

a. The R.I.Drop could be used where the drop in elevation is with in the range of 1.00 to 4.00 meters

b. The inlet of this structure may serve as a control to regulate the water depth in the upstream canal.

c. The inlet and outlet can be adapted to either an earth or a lined water way.

d. The inlet can be incorporated either with a control notch or with a check.

How to fit a R.I.Drop with the design condition

For fitting a R.I.Drop with the design condition, proceed with the following steps:

1. Collect the hydraulic properties of the canal at inlet and outlet of structure.

   let:

   b = Bottom width of the canal (m.)
   m = Side slope of the canal
   Y = Depth of flow (m.)
   S = Canal bottom slope
   n = Manning's roughness coefficient
   Q = Discharge (m^3/s)
   V = Velocity (m/s)
   h_V = Velocity head = $V^2/2g$ (m.)

2. Read the elevation of points A and D from the profile sheets.

   let:

   El.A = Elevation of point A.
   El.D = Elevation of point D.
   $El.A_W$ = Elevation of the normal water surface at point A.
   $El.D_W$ = Elevation of the normal water surface at point D.
   $El.A_E$ = Elevation of the energy gradient at point A.
   $El.D_E$ = Elevation of the energy gradient at point D.

3. From the " Standard Dimension Table", Dwg. No.11/1/2/02, for a given discharge, select the width of the R.I.Drop as well as the other dimensions listed on the table.

4. Decide whether to use check or control notch at the inlet.

   Recommendation

   If the amount of flow changes very often and it is required that the upstream canal water depth being controled select control notch.

   Control notch is designed to control upstream canal water depth and velocity for flow ranges between design flow and to about 0.2 of design flow.

   If the changes of flow is not very often check could be used.

5. If the control notch is selected, for calculating its dimensions, follow the steps presented on Dwg.No.12/5/2/01 and then proceed with the following steps.

6. Calculate the energy gradient at point A.

   $El.A_E = El.A + Y + h_V$

7. Calculate the energy gradient at point D using reduced n value. This reduced n should be 0.8 times the assumed design n for the canal. These smaller values of n are used as a factor of safety against possible lower canal water elevations than indicated using the rougher n value.

   $El.D_E = El.D + Y' + h'_V$

   Where Y' represents the depth of water at point D, using reduced n and h'_V which represents velocity head at the downstream when the depth of water is Y'.

8. Determine the drop value (H).

9. By knowing Q and H values and using the tables provided on Dwgs.No.11/1/2/01 and 11/1/2/02 the required structure numbers and corresponding dimensions can be selected.

10. The elevation of B and C could be calculated as follows:

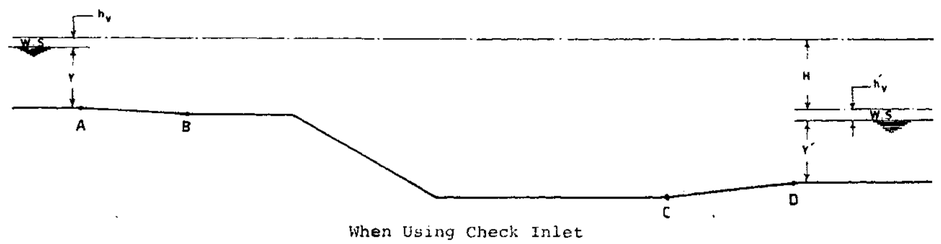
    $El.C = El.D_E - (Y_2 + h_{V_2})$

    $El.B = El.C + L_3/2$

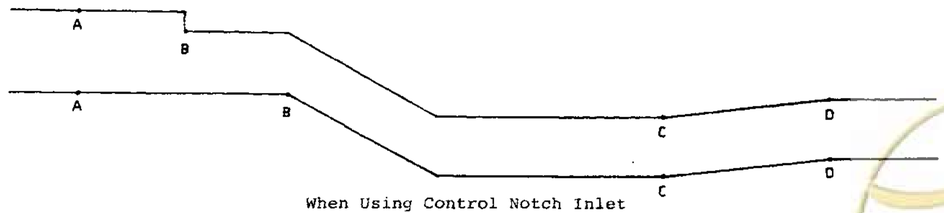
    If El.B is higher than El.A, select another structure to satisfy the condition.

11. All the structural data could be optained from the dimension tables and the reinforcement information could be optained by H_4 value of Dwgs. No. 11/1/3/01 to 11/1/3/03.

    Lists of reinforcement are shown on Dwgs.No. 11/1/3/04 through 11/1/3/27 indicated by structure numbers.



When Using Check Inlet



When Using Control Notch Inlet

Example

1&2. The following information is provided for the selection of a proper Rectangular Inclined Drop.

The hydraulic properties of upstream and downstream of the structures are the same.

b = 0.8 m.	Q = 1.2 m^3/s
m = 1.5:1	Y = 0.617 m.
s = 0.001	V = 1.13 m/s
n = 0.014	h_V = 0.065 m.
El.A = 102.18 m.	El.B = 99.78 m.

3. From the Standard Dimension Table: B = 1.85 m.

4. It is decided to use check control at the inlet.

6. $El.A_E = 102.18 + 0.617 + 0.065 = 102.86$

7. $n' = 0.8 \times 0.14 = 0.011$

   For detailed calculation of water depth, when reduced values of n i.e.(n') is used, the reader is referred to P.B.O publication No. 104.

   Y' = 0.549 V' = 1.33 h'_V = 0.093

   $El.D_E = 99.78 + 0.549 + 0.093 = 100.42$

8. H = 102.86 - 100.42 = 2.44

9. Use structure # 1200 - 250

10. $Y_2 + h_{V_2} = 1.027$

    El.C = 100.42 - 1.027 = 99.39 Take 99.40

    $L_3 = 5.40$

    $El.B = 00.40 + \frac{5.40}{2} = 102.10$

All the structural dimensions could be extracted from the table by using structure # 1200 -250.
